## Synthesis of compound 3

Scheme S1: Synthesis of compound 3. Reagents and Conditions: a) propargyl alcohol, $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2} / \mathrm{Cul}$, pyrrolidine/THF, $60^{\circ} \mathrm{C}$; b) $\mathrm{NH}_{3}-\mathrm{IPA}, \mathrm{MgSO}_{4}, \mathrm{MnO}_{2}$, THF, rt [1].

The monotopic molecular linker 3, with only one incorporated propiolonitrile group, was synthesized from 4-bromoterphenyl 6 following the multistep protocol (Scheme S1), which involves at first the cross-coupling reaction with propargyl alcohol in the presence of the catalytic amount of $\operatorname{Pd}(I I)$ salt. Secondly, 7 was converted into the corresponding nitrile 3 by treatment with ammonia in 2-propanol (IPA) and THF containing magnesium sulfate and manganese dioxide at room temperature for 2 hours.

## 3-([1,1':4',1"-terphenyl]-4-yl)prop-2-yn-1-ol (7)

4-bromo-1,1':4',1"-terphenyl (6, $412 \mathrm{mg}, 1.5 \mathrm{mmol}$ ), prop-2-yn-1-ol (126 mg, 2.25 $\mathrm{mmol}), \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{2} \mathrm{Cl}_{2}(50 \mathrm{mg})$, Cul $(30 \mathrm{mg}), \mathrm{PPh}_{3}(40 \mathrm{mg})$ were added to a mixture of 30 mL pyrrolidine and 15 mL THF and heated under reflux for 10 h under an argon atmosphere [2]. Hexane ( 50 mL ) was added, and the residue was filtered off and dissolved in dichloromethane. The solution was chromatographed on silica gel (hexane/dichloromethane 1:1) affording 120 mg of 7 as white needle-like crystals (yield 28\%).
${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta / \mathrm{ppm} 4.56$ (d, 2H, $-\mathrm{CH}_{2}-$ ), 7.36-7.74 (m, 13H, Ar-H). ${ }^{13} \mathrm{C}$ NMR (126 MHz, $\mathrm{CDCl}_{3}$ ): $\delta /$ ppm 140.75, 140.58, 140.54, 139.12, 132.20, 128.87, 127.61, 127.49, 127.39, 127.06, 126.89, 121.49, 87.90, 85.66, 51.79. IR ( $\mathrm{KBr}, \mathrm{cm}^{-1}$ ): 2184(C $\equiv \mathrm{C})$. MALDI ToF calculated for $\mathrm{C}_{21} \mathrm{H}_{16} \mathrm{O}: \mathrm{M}^{+}, 284.1$; found: $\mathrm{m} / \mathrm{z}, 284.0$.

## 3-([1,1':4',1"-terphenyl]-4-yl)propiolonitrile (3)

Following [1], a 2 M solution of ammonia in 2-propanol ( $0.8 \mathrm{~mL}, 1.6 \mathrm{mmol}$ ) and anhydrous magnesium sulfate ( $768 \mathrm{mg}, 6.4 \mathrm{mmol}$ ) were added to a stirred solution of compound 7 ( $114 \mathrm{mg}, 0.4 \mathrm{mmol}$ ) in THF ( 20 mL ). Then, activated manganese dioxide ( $557 \mathrm{mg}, 6.4 \mathrm{mmol}$ ) was added. The resulting mixture was stirred at room temperature for 2 h and then diluted with dichloromethane $(20 \mathrm{~mL})$. The mixture was filtered through Celite, washed well with dichloromethane, and the combined filtrates were concentrated in vacuum. The residue was purified by column chromatography on silica gel (hexane/dichloromethane 2:1) affording light yellow solid compound 3 ( $37 \mathrm{mg}, 33 \%$ ).
${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta / \mathrm{ppm} 7.41(\mathrm{t}, J=7.38,7.38 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 7.50(\mathrm{t}, J=$ $7.64,7.64 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 7.64-7.74(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Ar}-\mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (126 MHz, $\mathrm{CDCl}_{3}$ ): ס/ppm 144.19, 141.44, 140.25, 138.16, 134.06, 128.93, 127.79, 127.72, 127.56, 127.34, 127.08, 116.16, 105.61, 83.11, 63.79. IR ( $\mathrm{KBr}, \mathrm{cm}^{-1}$ ): $2263(\mathrm{C} \equiv \mathrm{N})$, 2143(C末C). MALDI ToF calculated for $\mathrm{C}_{21} \mathrm{H}_{13} \mathrm{~N}: \mathrm{M}^{+}$, 279.1; found: $\mathrm{m} / \mathrm{z}$, 279.0. Elemental analysis calculated (\%) for $\mathrm{C}_{21} \mathrm{H}_{13} \mathrm{~N}$ : C 90.29, H 4.69, N 5.01 ; found: C 90.24, H 4.91, N 5.07.

## Crystallographic study of the compound 2

Crystals of compound 2 suitable for XRD were grown from dichloromethane and dioxane solvents mixture. Compound 2 crystallizes in the monoclinic system with space group $P_{2} / n$. The asymmetric unit consists of a half of the crystallographically independent molecule of compound 2 (Table S 1 ). The twist angles between phenyl rings are $31^{\circ}$ (Figure S1a, b). The long axis of the molecule is distorted such that carbon atoms connecting the phenyl rings deviate from the straight line connecting the terminal nitrogen atoms. Similar distortions are quite common for molecules with aromatic rings connected in para position [4,5]. Within the solid phase of compound 2, the shortest $\mathrm{CH} \cdots \mathrm{N} \equiv \mathrm{C}$ hydrogen bond distances are $2.89 \AA$ and $2.70 \AA(\mathrm{~N} \cdots \mathrm{H}$ separation). The chain formation of $\mathrm{NC}-\mathrm{C} \equiv \mathrm{C}-\mathrm{Ph}_{3}-\mathrm{C} \equiv \mathrm{C}-\mathrm{CN}$ results from H bonding and $\pi$-stacking. The different layers stack in molecular columns oriented along the $b$ axis with identical arrangement of the individual moieties resulting in a $\pi$-stacking distance of 3.39 Å as can be seen in Figure S1b, typically appearing for $\pi$-stacking.

Figure S1: The crystal structure of compound 2 as obtained by X-ray structure analysis. a) Molecules arrange in parallel layers. Propiolonitrile groups acquire an antiparallel ordering motif. One H bond of the $\mathrm{N} \cdots \mathrm{CH}$ type is present (b). All distances are given in $\AA$.

## Crystallographic study of the mono-topic by-product 3

Crystals of compound 3 suitable for XRD were grown from dichloromethane and hexane solvents mixture. Compound $\mathbf{3}$ crystallizes in the triclinic system with space group $P-1$. The asymmetric unit consists of three crystallographically independent molecules of compound 3 (Table S3). All three molecules exhibit screw-like structures resulting from a gradual rotation of the phenyl rings. In contrast to the ditopic molecule 2, the twist angles between phenyl rings $A / B$ and $B / C$ are $33^{\circ}$ and $10^{\circ}$ respectively. The twist angles between phenyl rings in the other two independent molecules are average of $35^{\circ}$ (Figure S3). Each nitrogen atom establishes two $\mathrm{CH} \cdots \mathrm{N}$ hydrogen bonds, one connecting to the neighboring molecule within the layer (Figure S3) with a $\mathrm{N} \cdots \mathrm{H}$ separation of $2.56 \AA$ and one connecting to a molecule of the next layer with the separation of 2.62 Å. As can be seen in Figure S3, a layer-bylayer arrangement is present in the crystal phase, too, but no direct stacking of identically oriented molecules as in the case of compound $\mathbf{2}$ takes place.

Figure S2: ORTEP plot of compounds 3 with ellipsoids drawn at $30 \%$ level of probability for all non-hydrogen atoms, indicating the numbering scheme.

Figure S3: The crystal structure of compound 3 as obtained by XRD analysis. a,b) 3D visualization of the molecular conformation (view along direction c); c) Molecules arrange in parallel layers. Propiolonitrile groups acquire an antiparallel ordering motif. Two H bonds of the $\mathrm{N} \cdots \mathrm{CH}$ type are present. All distances are given in $\AA$.
