Figure S1 shows the TiO₂ nanotube arrays prepared by the one-step anodization process. The TiO₂ nanotubes exhibit a self-assembled structure. The diameter and length of the TiO₂ nanotubes are about 85 nm and about 6.5 μ m, respectively, with the diameter being similar to the TiO₂ nanotubes prepared by the two-step anodization process. The SEM image of the TiO₂ nanotubes shown in Figure S1c reveals a "bamboo-like" structure on the outermost surface of the TiO₂ nanotubes. From Figure S1d, one can conclude that well-aligned nanotubes grew vertically from the surface of the Ti foil.

Figure S2 shows the SEM images of the top surface of the TiO_2 nanotube arrays with Ag nanofilm after heat treatment at different temperatures. Without any teat treatment, the Ag nanofilm generally covered the top of the TiO_2 nanotube arrays (Figure S2a) and made the topology of nanotubes indistinguishable. With the heat treatment at 300 °C for 2 h, dewetting of the Ag nanofilm and the migration/diffusion of Ag atoms into the TiO_2 nanotube arrays

occurred. The Ag nanofilm became irregular, and the amount of Ag on the top of the TiO_2 nanotube arrays decreased. The irregularity of the Ag nanofilm increases with the increase of the heat-treatment temperature for the same heating time, and the amount of Ag on the top of the TiO_2 nanotube arrays decreases with the increase of the heating time and heat-treatment temperature.

Figure S3 shows the line scan of EDS of the cross section of the TiO_2 nanotube arrays with Ag nanofilm, which was heat-treated at 400 °C for 2 h. The line scan reveals the migration/diffusion of Ag into the TiO_2 nanotube arrays.

Figure S4 shows the EDX patterns of the TiO_2 nanotube arrays with Ag nanofilm after heat treatment at 500 °C for 2 h. The EDX result reveals the presence of Ti, O, and Ag, confirming the existence of Ag around the TiO_2 nanotubes.

Figure S5 shows the TEM images of the TiO_2 nanotube arrays with Ag nanofilm after heat treatment at 500 °C for 1 h. The images reveal the presence of Ag nanoparticles on the surface of TiO_2 nanotubes and the characteristic lattice fringe of 3.52 Å for TiO_2 nanotubes and 2.36 Å for Ag nanoparticles.

Figure S6 shows the SEM images of anatase TiO_2 nanotube arrays with Ag nanofilm after heat treatment at 500 °C for 2 h. The images reveal the presence of Ag on the outmost surface of TiO_2 nanotubes, suggesting that Ag atoms diffused through the space between anatase TiO_2 nanotubes, similar to the amorphous TiO_2 nanotubes.

Figure S7 shows the TEM images of the Ag/TiO₂ nanotubes after heat treatment at 500 °C for 2 h and the corresponding size distribution of Ag nanocrystals.

Figure S1: SEM images of pure TiO_2 nanotube arrays prepared by one-step anodization; (a) overview of the TiO_2 nanotube arrays, (b) top topology of the TiO_2 nanotube arrays, (c) side view of the TiO_2 nanotube arrays showing the bamboo-like structures on the surface of the TiO_2 nanotube arrays, and (d) bottom surface of the TiO_2 nanotube arrays.

Figure S2: SEM images of the top surface of the TiO_2 nanotube arrays with Ag nanofilm after heat treatment at different temperatures; (a) before heat treatment; (b) 300 °C for 2 h; (c) 400 °C for 2 h; (d) 500 °C for 2 h.

Figure S3: EDS line scan of the TiO_2 nanotube arrays with Ag nanofilm after the heat treatment at 400 °C for 2 h, showing the migration/diffusion of Ag into the TiO_2 nanotube arrays.

Figure S4: EDX pattern of the TiO₂ nanotube arrays with Ag nanofilm after heat treatment at 500 °C for 2 h.

Figure S5: TEM images of the TiO_2 nanotube arrays with Ag nanofilm after heat treatment at 500 °C for 1 h; (a) Ag nanoparticles on the surface of TiO_2 nanotubes, and (b) HRTEM image showing the characteristic lattice fringes of 3.52 Å for TiO_2 nanotubes and 2.36 Å for Ag.

Figure S6: SEM images of anatase TiO_2 nanotube arrays with Ag nanofilm after heat treatment at 500 °C for 2 h; (a) Top view, and (b) side view showing the presence of Ag on the outmost surface of TiO_2 nanotubes.
