## 1. Synthesis of modified monomer 1

Ethyl 2-(5-aminomethyluracil-1-yl)acetate trifluoroacetate salt (3). In a round bottom flask ethyl 2-(5-azidomethyluracil-1-yl)acetate [1] ( $1.10 \mathrm{~g}, 4.33 \mathrm{mmol}$ ) was solubilized in 20 mL THF, then water ( $0.156 \mathrm{~mL}, 8.67 \mathrm{mmol}$ ) was added and the reaction mixture was cooled to $0{ }^{\circ} \mathrm{C}$ with an ice bath before the addition of triphenylphosphine ( $1.70 \mathrm{~g}, 6.50 \mathrm{mmol})$. The reaction was left to warm to rt and to react overnight. The solvent was then evaporated under reduced pressure, the crude product was taken up with a minimum amount of TFA then precipitated with $\mathrm{Et}_{2} \mathrm{O}$, collected by centrifugation and washed with DCM (3 times) to yield $\mathbf{3}$ as white solid ( $0.70 \mathrm{~g}, 71 \%$ ). TLC ( $\mathrm{AcOEt} / \mathrm{MeOH} / \mathrm{NH}_{3}$ (aq) $5: 4: 1$ ) Rf: 0.32 ; MP $\left({ }^{\circ} \mathrm{C}\right): 113.8-115.2 ;{ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }^{6}, 300 \mathrm{MHz}\right) \delta$ (ppm): $11.84(1 \mathrm{H}, \mathrm{s}), 7.99(3 \mathrm{H}, \mathrm{br} \mathrm{s}), 7.88(1 \mathrm{H}, \mathrm{s}), 4.56(2 \mathrm{H}, \mathrm{s}), 4.16(2 \mathrm{H}, \mathrm{q}, \mathrm{J}=7.1 \mathrm{~Hz}), 3.65(2 \mathrm{H}$, $\mathrm{d}, \mathrm{J}=5.0 \mathrm{~Hz}), 1.21(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.1 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR (DMSO-d ${ }^{6}$, 75 MHz$) \delta(\mathrm{ppm}): 167.7,163.2,158.2$ $(\mathrm{q}, \mathrm{J}=34 \mathrm{~Hz}), 150.4,146.1,116.3(\mathrm{q}, \mathrm{J}=296 \mathrm{~Hz}), 105.7,61.1,48.8,35.1$, 13.8; MS (ESI, MeOH): $\mathrm{m} / \mathrm{z}$ calcd for $\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{4}[\mathrm{M}]$ : 227.0906, found: $228.2[\mathrm{M}+\mathrm{H}]^{+}, 455.4[2 \mathrm{M}+\mathrm{H}]^{+}$; Elemental
composition: calcd \%C 38.72, \%H 4.14, \%N 12.31, found \%C38.85, \%H 4.40, \%N 12.28; FT-IR $(\mathrm{KBr}) \mathrm{n}\left(\mathrm{cm}^{-1}\right): 3566(\mathrm{~m}), 3446(\mathrm{~m}), 3200(\mathrm{~m}), 2998(\mathrm{~m}), 2829(\mathrm{~m}), 1728(\mathrm{~s}), 1713(\mathrm{~s}), 1667(\mathrm{~s})$.

Ethyl 2-(5-(2-(pyren-1-yl)acetamido)methyluracil-1-yl)acetate (4). In a round bottom flask 1pyreneacetic acid ( $305 \mathrm{mg}, 1.17 \mathrm{mmol}$ ) and HBTU ( $434 \mathrm{mg}, 1.15 \mathrm{mmol}$ ) were dissolved in 5 mL DMF, the solution was then cooled to $0{ }^{\circ} \mathrm{C}$ with an ice bath and DIPEA was added ( $485 \mu \mathrm{~L}, 2.94$ $\mathrm{mmol})$. The mixture was left to react for 30 minutes at $0^{\circ} \mathrm{C}$, then to warm to rt. After 30 minutes 3 $(200 \mathrm{mg}, 0.59 \mathrm{mmol})$ was added and the mixture was left to react overnight. 4 was then collected as a beige solid over a Büchner funnel after precipitation from the reaction mixture with 20 mL AcOEt and $20 \mathrm{~mL} \mathrm{H} \mathrm{H}_{2} \mathrm{O}$. A second aliquot of product was collected by precipitation with 20 mL hexane from the organic layer washed with saturated $\mathrm{KHSO}_{4}(2 \times 50 \mathrm{~mL})$, saturated $\mathrm{NaHCO}_{3}(2 \times 50 \mathrm{~mL})$ and brine ( 50 mL ). Yield: $183 \mathrm{mg}, 66 \%$. TLC ( $\left.\mathrm{AcOEt} / \mathrm{MeOH} / \mathrm{NH}_{3}(\mathrm{aq}) 5: 4: 1\right) \mathrm{Rf}: 0.33$; MP $\left({ }^{\circ} \mathrm{C}\right)$ : decompose without melting at $226^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }^{6}, 400 \mathrm{MHz}\right) \delta(\mathrm{ppm}): 11.57(1 \mathrm{H}, \mathrm{s}), 8.53$ $(1 \mathrm{H}, \mathrm{t}, \mathrm{J}=5.5 \mathrm{~Hz}), 8.41(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.3 \mathrm{~Hz}), 8.29(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.5 \mathrm{~Hz}), 8.24(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.8 \mathrm{~Hz}), 8.20$ $(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.3 \mathrm{~Hz}), 8.15(2 \mathrm{H}, \mathrm{s}), 8.07(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.6 \mathrm{~Hz}), 8.02(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.9 \mathrm{~Hz}), 7.53(1 \mathrm{H}, \mathrm{s}), 4.46$ $(2 \mathrm{H}, \mathrm{s}), 4.24(2 \mathrm{H}, \mathrm{s}), 4.10(2 \mathrm{H}, \mathrm{q}, \mathrm{J}=7.1 \mathrm{~Hz}), 3.92(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=5.4 \mathrm{~Hz}), 1.17(3 \mathrm{H}, \mathrm{t}, \mathrm{J}=7.1 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR (DMSO-d $\left.{ }^{6}, 100 \mathrm{MHz}\right) \delta(\mathrm{ppm}): 170.7,168.4,163.9,151.2,143.5,131.3,131.4,130.8,130.2$, $129.5,129.1,127.8,127.7,127.3,126.6,125.6,125.4,125.2,124.6,124.4,110.7,61.6,49.2,40.4$, 35.7, 14.4; MS (ESI, MeOH): $m / z$ calcd for $\mathrm{C}_{27} \mathrm{H}_{23} \mathrm{~N}_{3} \mathrm{O}_{5}[\mathrm{M}]: 469.16377$, found: $470.4[\mathrm{M}+\mathrm{H}]^{+}$, $492.3[\mathrm{M}+\mathrm{Na}]^{+}, 508.3[\mathrm{M}+\mathrm{K}]^{+}, 468.4[\mathrm{M}-\mathrm{H}]^{-}, 504.4[\mathrm{M}+\mathrm{Cl}]^{-} ;$HRMS $(\mathrm{MeOH}): \mathrm{m} / \mathrm{z}$ calcd for $\left[\mathrm{C}_{27} \mathrm{H}_{24} \mathrm{~N}_{3} \mathrm{O}_{5}\right]^{+}: 470.17105$, found: 470.17075; FT-IR (KBr) n ( $\mathrm{cm}^{-1}$ ): 3041 (m), 1670 (s), 1684 (s), 1472 (w).

2-(5-(2-(Pyren-1-yl)acetamido)methyluracil-1-yl)acetic acid (5). In a round bottom flask 4 (248 $\mathrm{mg}, 0.53 \mathrm{mmol}$ ) was dissolved in $10 \mathrm{~mL} \mathrm{MeOH}, 5 \mathrm{~mL} 1 \mathrm{M} \mathrm{NaOH}$ were added and the mixture and left to react overnight. The organic solvent was then evaporated under vacuum, the pH was lowered
to 3 with $37 \% \mathrm{HCl}$ and $\mathbf{5}$ was collected over a Büchner funnel as a red solid. Yield: $212 \mathrm{mg}, 91 \%$. TLC (AcOEt) Rf: 0.00 (check for the absence of 4); MP $\left({ }^{\circ} \mathrm{C}\right.$ ): decompose without melting at $165^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR (DMSO-d $\left.{ }^{6}, 400 \mathrm{MHz}\right) \delta(\mathrm{ppm}): 13.15(1 \mathrm{H}, \mathrm{br} \mathrm{s}), 11.52(1 \mathrm{H}, \mathrm{s}), 8.51(1 \mathrm{H}, \mathrm{br} \mathrm{t}, \mathrm{J}=5.4 \mathrm{~Hz})$, $8.40(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.3 \mathrm{~Hz}), 8.29(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.6 \mathrm{~Hz}), 8.24(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.9 \mathrm{~Hz}), 8.20(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=9.3 \mathrm{~Hz})$, $8.15(2 \mathrm{H}, \mathrm{s}), 8.08(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.6 \mathrm{~Hz}), 8.02(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=7.9 \mathrm{~Hz}), 7.56(1 \mathrm{H}, \mathrm{s}), 4.39(2 \mathrm{H}, \mathrm{s}), 4.25(2 \mathrm{H}$, s), $3.92(2 \mathrm{H}, \mathrm{d}, \mathrm{J}=5.2 \mathrm{~Hz}) ;{ }^{13} \mathrm{C}$ NMR (DMSO-d $\left.{ }^{6}, 100 \mathrm{MHz}\right) \delta(\mathrm{ppm}): 170.7,169.9,164.0,151.2$, 143.7, 131.4, 131.3, 130.8, 130.2, 129.5, 129.1, 127.8, 127.7, 127.3, 126.6, 125.5, 125.4, 125.2, 124.6, 124.4, 110.5, 49.3, 49.2, 35.8; MS (ESI, MeOH): $m / z$ calcd for $\mathrm{C}_{25} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{5}$ [M]: 441.13247, found: $442.2[\mathrm{M}+\mathrm{H}]^{+}, 464.3[\mathrm{M}+\mathrm{Na}]^{+}, 480.2[\mathrm{M}+\mathrm{K}]^{+}, 905.6[2 \mathrm{M}+\mathrm{Na}]^{+}, 440.3[\mathrm{M}-\mathrm{H}]^{-}, 881.6[2 \mathrm{M}-$ $\mathrm{H}]^{-}$, $903.6[2 \mathrm{M}+\mathrm{Na}-2 \mathrm{H}]^{-}$; HRMS (MeOH) $\mathrm{m} / \mathrm{z}$ calcd for $\left[\mathrm{C}_{25} \mathrm{H}_{18} \mathrm{~N}_{3} \mathrm{O}_{5}\right]^{\text {: }}$ : 440.12579, found: 440.12518; FT-IR (KBr) n ( $\mathrm{cm}^{-1}$ ): 3041 (m), 1700 (s), 1684 (s), 1472 (w).
tert-Butyl 2-(N-(2-Fmoc-aminoethyl)-2-(5-(2-(pyren-1-yl)acetamido)methyluracil-1yl)acetamido)acetate (6). Following a similar procedure described in [35], in a round bottom flask $5(200 \mathrm{mg}, 0.452 \mathrm{mmol})$ was solubilized in 2 mL dry DMF at $0^{\circ} \mathrm{C}$ together with $\mathrm{EDC} \cdot \mathrm{HCl}(104$ $\mathrm{mg}, 0.543 \mathrm{mmol}), \mathrm{DhBtOH}(74 \mathrm{mg}, 0.453 \mathrm{mmol})$ and DIPEA ( $179 \mu \mathrm{~L}, 1.086 \mathrm{mmol}$ ) and left to react for 10 minutes before warming to rt . After 20 minutes tert-butyl 2-((2-Fmocaminoethyl)amino)acetate hydrochloride ( $104 \mathrm{mg}, 0.543 \mathrm{mmol}$ ) was added and the reaction mixture was stirred for further 4 h . The reaction was then diluted with 200 mL AcOEt and washed with saturated $\mathrm{KHSO}_{4}(2 \times 200 \mathrm{~mL})$, saturated $\mathrm{NaHCO}_{3}(2 \times 200 \mathrm{~mL})$ and brine $(200 \mathrm{~mL})$. The organic fraction was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated under vacuum. Flash chromatography (from AcOEt to AcOEt/MeOH 9:1) yielded 6 as pale brown solid. Yield: $252 \mathrm{mg}, 68 \%$. ## 4. UV measurements

### 4.1 Calculation of the extinction coefficient for 5.

A stock solution of $\mathbf{5}$ was prepared in $\mathrm{H}_{2} \mathrm{O}(1.17 \mathrm{mg}$ in $2.0 \mathrm{~mL}, 1.32 \mathrm{mM})$. From this solution an intermediate 1:10 dilution was prepared, which was used to prepare the final solutions with a 1:100, 1.5:100, 2:100, 3:100, 5:100, 7.5:100 dilution. Each solution was prepared in triplicate and the absorbance of the solutions were evaluated within the range of $200-500 \mathrm{~nm}$ at a scan speed of 100 $\mathrm{nm} / \mathrm{min}$.

Figure S12: Linear regression for the evaluation of the extinction coefficient of $\mathbf{5}$ at 260 nm and 343 nm .

### 4.2 Variable temperature UV measurements.

Figure S13: Relative absorbance at 260 nm as a function of temperature for PNA:DNA1 complexes for melting (upper row) and annealing (lower row) processes. All measurements were done in PBS buffer, pH 7; concentration of each strand was $1 \mu \mathrm{M}$.

Figure S14: Relative absorbance at 260 nm as a function of temperature for PNA:DNA2 complexes for melting (upper row) and annealing (lower row) processes. All measurements were done in PBS buffer, pH 7 ; concentration of each strand was $1 \mu \mathrm{M}$.

Table S1: UV melting temperatures of PNA:DNA complexes. All measurements were done in PBS at pH 7 and $1 \mu \mathrm{M}$ strand concentration except for unmodified PNA measurements that were conducted at $5 \mu \mathrm{M}$ strands concentration. $\Delta T m$ refers to the difference between melting and annealing temperatures.

| PNA | With DNA1 $\left({ }^{\circ} \mathrm{C}\right)$ |  |  | With DNA2 $\left({ }^{\circ} \mathrm{C}\right)$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## 5. Fluorescence measurements

### 5.1 Fluorescence analysis at variable temperature.

Fluorescence spectra were recorded on a Perkin Elmer LS55 Luminescence Spectrometer equipped with a LAUDA ECOline RE104 temperature control system, exciting at 347 nm (slit: 5.0 nm ), scanning from 370 nm to 550 nm , a scan speed of $200 \mathrm{~nm} / \mathrm{min}$ was used and 3 accumulation for each spectrum. Samples were prepared as reported for UV measurements. All the samples were first incubated at $90{ }^{\circ} \mathrm{C}$ for 5 min , then slowly cooled to $10{ }^{\circ} \mathrm{C}$. Fluorescence spectra were recorded every $5{ }^{\circ} \mathrm{C}$ allowing the sample to equilibrate 5 min to the new temperature before the new record. All measurements were compensated for lamp fluctuations by normalization using as reference a solution containing 20 nM 1-pyreneacetic acid in PBS. The results obtained are reported in Figure S15.

Figure S15: Fluorescence intensities of pyrene-modified PNA and their complexes as a function of temperature (excitation at 347 nm and emission at 470 nm ); red squares are for ssPNA solutions, green triangles are for PNA:DNA1 solutions and purple cross are for PNA:DNA2 solutions; a) PNA1, b) PNA2, c) PNA3, d) PNA4, e) PNA5, f) PNA6. All measurements were done in PBS buffer at pH 7 ; concentration of each strand was $1 \mu \mathrm{M}$.

### 5.2 Fluorescence intensity of PNA2 relative to that of 1-pyreneacetic acid

From a 1 mM solution ( 2.6 mg in 100 ml ) of 1-pyreneacetic acid in 10 mM NaOH , a $1 \mu \mathrm{M}$ solution in PBS was prepared by dilution; the concentration of 1-pyreneacetic acid in this sample was checked by UV measurements at 347 nm ; a $1 \mu \mathrm{M}$ solution of PNA2 was also prepared as described above. From these solutions samples of 200 nM concentration were prepared. Fluorescence emission spectra were recorded with an excitation wavelength of 347 nm (slit excitation: 5.0 nm ), scanning from 370 nm to 550 nm (slit emission: 5.0 nm ), a scan speed of $200 \mathrm{~nm} / \mathrm{min}$ was used with 3 spectra accumulation for each solution. The spectra obtained are reported in Figure S15.

Figure S16: Fluorescence spectra (a) and $10 \times$ zoom (b) at 347 nm excitation, recorded at $20^{\circ} \mathrm{C}$. Grey lines: 200 nM PNA2; black lines: 200 nM 1-pyreneacetic acid. All measurement were done in PBS buffer, pH 7 at $20^{\circ} \mathrm{C}$.

The fluorescence quantum yield of the PNA2 probe with excitation at 347 nm ( $\phi_{\text {PNA } 2}$ ) was compared with that of 1-pyreneacetic acid ( $\phi_{\mathrm{pyr}}$ ); the relative quantum yield ( $\phi_{\mathrm{PNA} 2} / \phi_{\mathrm{pyr}}$ ) at $20{ }^{\circ} \mathrm{C}$ was found to be 0.043 . Since at the working conditions ( $0.2 \mu \mathrm{M}$ concentration) the shapes of the emission spectra of 1-pyreneacetic and PNA2 are the same, and the refractive indexes of both dilute solutions in the same buffer are the same, the following simplified formula was used:

$$
\phi_{\mathrm{PNA} 2} / \phi_{\mathrm{pyr}}=\left(\mathrm{I}_{\mathrm{PNA} 2} / \mathrm{I}_{\mathrm{Pyr}}\right) \times\left[\left(1-10^{-\mathrm{A}_{\mathrm{Pyr}}}\right) /\left(1-10^{-\mathrm{A}_{\mathrm{PNA} 2}}\right)\right]
$$

where $\mathrm{I}_{\mathrm{PNA} 2}$ and $\mathrm{I}_{\mathrm{Pyr}}$ refer to the integral of the emitted fluorescence of PNA2 and of 1-pyreneacetic acid, and $\mathrm{A}_{\mathrm{pyr}}$ and $\mathrm{A}_{\mathrm{PNA} 2}$ are the corresponding absorbances at the excitation wavelength.

### 5.3 Fluorescence titration of PNA3

This titration was carried out as described for PNA 2 in the Experimental Part, but at $10^{\circ} \mathrm{C}$ in order to prevent complete dissociation of the complex (see Figure S15). The results are reported in Figure S17.

Figure S17: Fluorescence titration PNA3 with DNA1 (squares) or DNA2 (circles). All measurements were done in PBS buffer, pH 7 ; concentration of each PNA strand was $1 \mu \mathrm{M}$. All data were normalized for the fluorescence intensity of the starting ssPNA solution. Conditions: $T=10^{\circ} \mathrm{C}$, emission slit $=10 \mathrm{~nm}$.

### 5.4 Determination of the limit of detection (LOD) for DNA1 using PNA2 as probe

From the stock solution described above single stranded PNA2 solution ( $1 \mu \mathrm{M}$ in PBS) and single stranded DNA1 solution ( $4 \mu \mathrm{M}$ in PBS) were prepared. From these, samples with different DNA concentrations ( $0,20,40,60$ and 80 nM , triplicate) were prepared. Fluorescence emission spectra were recorded with excitation wavelength of 347 nm (slit excitation: 5.0 nm ), scanning from 370 nm to 550 nm (slit emission: 5.0 nm ), a scan speed of $200 \mathrm{~nm} / \mathrm{min}$ was used with 3 spectra accumulation for each solution, allowing each sample to incubate 10 minutes at $20{ }^{\circ} \mathrm{C}$ before analysis. From the data collected, using the 474 nm fluorescence intensity (I) as a function of DNA1 concentration ( nM ), a linear regression was calculated: $I=23 \pm 2+0.30 \pm 0.03 \cdot\left[\right.$ DNA1] $\left(n=12, \mathrm{R}^{2}=\right.$ 0.911 ). A Mandel test was performed to confirm the significance of the linear model. From this linear regression the calculated LOD was 18.7 nM .

### 5.5 Base selectivity

Solutions of PNAs with all four base permutations were prepared at $1 \mu \mathrm{M}$ PNA strand concentration as described above. All the samples were first incubated at $90{ }^{\circ} \mathrm{C}$ for 5 min , then slowly cooled to $10{ }^{\circ} \mathrm{C}$. Fluorescence spectra were recorded every $5{ }^{\circ} \mathrm{C}$ allowing the sample to equilibrate 5 min to the new temperature before the new record. All measurements were compensated for lamp fluctuations by normalization using as reference a solution containing 20 nM 1-pyreneacetic acid in PBS. The results obtained are reported in Figure S18.

Figure S18: Normalized fluorescence $474 \mathrm{~nm} / 379 \mathrm{~nm}$ ratio for PNA/DNA solution ( $5^{\prime}$ '-AGT GXA GGA-3', were X is the base reported in the legend). All measurements were done in PBS buffer, pH 7 ; concentration of each PNA strand was $1 \mu \mathrm{M}$ and each DNA strand was $0.5 \mu \mathrm{M}$. All data were normalized for the fluorescence ratio of the PNA2/DNA1 solution ( $\mathrm{X}=$ adenine). Conditions: $T=20^{\circ} \mathrm{C}$, emission slit $=10 \mathrm{~nm}$, accumulation $=3$.

## 6. Circular dichroism titration of PNA7

Circular dichroism spectra were recorded with a Jasco J715 spectropolarimeter and a PTC 348 temperature controller unit, collecting 3 scan each spectra. From a $100 \mu \mathrm{M}$ stock solution a single stranded DNA solution ( $5 \mu \mathrm{M}$ in PBS) was prepared, while the PNA stock solution was directly used for the titration. The DNA solution was first incubated at $15{ }^{\circ} \mathrm{C}$ then spectra were recorded after addition of portions of PNA $(6.25 \mu \mathrm{~L})$, allowing an equilibration time of 5 min . Solution concentration of DNA and PNA were checked by UV measurement to avoid dilution errors. The results are shown in Figure S19.

Figure S19: CD titration of DNA1 with PNA7 followed by circular dichroism. Arrows indicate signal variation after subsequent addition of PNA. Inside the frame: plot of the variation of the signal at 270 nm .
