## Experimental procedures and data

All reactions in organic medium were performed in standard oven-dried glassware under an inert atmosphere of nitrogen using freshly distilled solvents. $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was distilled from $\mathrm{CaH}_{2}$ and DMF from ninhydrin, and kept over molecular sieves. Solvents and reagents were deoxygenated when necessary by purging with nitrogen. Water used for lyophilization of final dendrimers was nanopure grade, purified through Barnstead NANOPure II Filter with Barnstead MegOhm-CM Sybron meter. All reagents were used as supplied without prior purification unless otherwise stated, and obtained from Sigma-Aldrich Chemical Co. Ltd. Reactions were monitored by analytical thin layer chromatography using silica gel 60 F 254 precoated plates (E. Merck) and compounds were visualized by 254 nm light, a mixture of iodine/silica gel and/or mixture of ceric ammonium molybdate solution ( $\left.100 \mathrm{~mL} \mathrm{H}_{2} \mathrm{SO}_{4}, 900 \mathrm{~mL} \mathrm{H}_{2} \mathrm{O}, 25 \mathrm{~g}\left(\mathrm{NH}_{4}\right)_{6} \mathrm{Mo}_{7} \mathrm{O}_{24} \mathrm{H}_{2} \mathrm{O}, 10 \mathrm{~g} \mathrm{Ce}\left(\mathrm{SO}_{4}\right)_{2}\right)$ and subsequent development by gentle warming with a heat-gun. Purifications were performed by flash column chromatography using silica gel from Silicycle ( $60 \AA, 40-63 \mu \mathrm{~m}$ ) with the indicated eluent.

## NMR, IR spectroscopies and MS spectrometry

${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded at 300 or 600 MHz and 75 or 150 MHz , respectively, on a Bruker spectrometer ( 300 MHz ) and Varian spectrometer $(600 \mathrm{MHz})$. All NMR spectra were measured at $25^{\circ} \mathrm{C}$ in indicated deuterated solvents. Proton and carbon chemical shifts ( $\delta$ ) are reported in ppm and coupling constants $(J)$ are reported in Hertz $(\mathrm{Hz})$. The resonance multiplicity in the ${ }^{1} \mathrm{H}$ NMR spectra are described as " $s$ " (singlet), " $d$ " (doublet), " $t$ " (triplet), and " $m$ " (multiplet) and broad resonances are indicated by "br". Residual protic solvent of $\mathrm{CDCl}_{3}\left({ }^{1} \mathrm{H}, \delta 7.27 \mathrm{ppm} ;{ }^{13} \mathrm{C}, \delta 77.0 \mathrm{ppm}\right.$ (central resonance of the triplet)), $\mathrm{D}_{2} \mathrm{O}\left({ }^{1} \mathrm{H}, \delta 4.79 \mathrm{ppm}\right.$ and 30.89 ppm for $\mathrm{CH}_{3}$ of acetone for ${ }^{13} \mathrm{C}$ spectra of de- $O$-acetylated compounds), MeOD ( ${ }^{1} \mathrm{H}, \delta 3.31 \mathrm{ppm}$ and ${ }^{13} \mathrm{C}, \delta 49.0 \mathrm{ppm}$. 2D Homonuclear correlation ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY together with 2D heteronuclear correlation ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ HSQC experiments were used to confirm NMR peak assignments.

Fourier transform infrared (FTIR) spectra were obtained with Thermo-scientific, Nicolet model 6700 equipped with ATR. The absorptions are given in wavenumbers $\left(\mathrm{cm}^{-1}\right)$. The intensity of the bands is described as $s$ (strong), $m$ (medium) or $w$ (weak). Melting points were measured on an Electrothermal MELTEMP apparatus and are uncorrected.
Accurate mass measurements (HRMS) were performed on a LC-MSD-ToF instrument from Agilent Technologies in positive electrospray (ES) mode. Low-resolution mass spectra were performed on the same apparatus or on a LCQ Advantage ion trap instrument from Thermo Fisher Scientific in positive electrospray mode (Mass Spectrometry Laboratory (Université de Montréal), or Plateforme analytique pour molécules organiques (Université du Québec à Montréal), Québec, Canada). Either protonated molecular ions $[\mathrm{M}+n \mathrm{H}]^{n+}$ or adducts $[\mathrm{M}+n \mathrm{X}]^{n+}\left(\mathrm{X}=\mathrm{Na}, \mathrm{K}, \mathrm{NH}_{4}\right)$ were used for empirical formula confirmation.

## General procedures

## Procedure A: multiple CuAAc couplings on polypropargylated cores

To a solution of polypropargylated core (1.00 equiv) and complementary azido synthon ( 1.25 equiv/propargyl) in a THF/ $\mathrm{H}_{2} \mathrm{O}$ mixture ( $1: 1$ ) were added sodium ascorbate ( 0.30 equiv/propargyl) and $\mathrm{CuSO}_{4} \cdot 5 \mathrm{H}_{2} \mathrm{O}$ ( 0.30 equiv/propargyl). The reaction mixture was stirred at $50{ }^{\circ} \mathrm{C}$ for 3 h then at room temperature for an additional 16 h period. EtOAc $(10 \mathrm{~mL})$ was added and the resulting solution was poured in a separatory funnel containing 25 mL of EtOAc and 30 mL of a saturated aqueous solution of $\mathrm{NH}_{4} \mathrm{Cl}$. Organics were washed with $(2 \times 25 \mathrm{~mL})$ of saturated $\mathrm{NH}_{4} \mathrm{Cl}_{\mathrm{aq}}$, water $(2 \times 20 \mathrm{~mL})$ and brine $(10 \mathrm{~mL})$. The organic phase was then dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure. Column chromatography on silica (DCM/MeOH 100:0 to 90:10) afforded the desired glycocluster.

## Procedure B: Zemplén de- $O$-acetylation procedure for insoluble derivatives

The acetylated compound was dissolved in anhydrous MeOH and a solution of sodium methoxide ( 1 M in $\mathrm{MeOH}, 5 \mu \mathrm{~L}$ every 20 minutes until precipitation) was added. An additional $100 \mu \mathrm{~L}$ was then injected and the heterogeneous reaction mixture was stirred at room temperature for 24 h . The solvent was then removed with a Pasteur pipette and a mixture of anhydrous $\mathrm{MeOH} / \mathrm{DCM}(4: 1,5 \mathrm{~mL})$ was added to the residual white foam. A vigorous agitation was maintained for an additional 15 min period. After removal of the solvents with a Pasteur pipette, the residue was dissolved in $\mathrm{H}_{2} \mathrm{O}(3 \mathrm{~mL})$, and the pH was adjusted to $6-7$ with addition of ion-exchange resin (Amberlite IR $120 \mathrm{H}^{+}$). After filtration, the solvent was removed under vacuum with rotary evaporator, lyophilized to yield the fully deprotected glycocluster.

Synthesis of peracetylated trivalent derivative (4): Derivative $\mathbf{4}$ was synthesized according to Procedure A with tripropargylated core $2(15.4 \mathrm{mg}, 47.9 \mu \mathrm{~mol}, 1.00$ equiv), mannoside $3(75.0 \mathrm{mg}, 180 \mu \mathrm{~mol}$, 3.75 equiv), sodium ascorbate ( $8.5 \mathrm{mg}, 43 \mu \mathrm{~mol}, 0.90$ equiv) and $\mathrm{CuSO}_{4} \cdot 5 \mathrm{H}_{2} \mathrm{O}(10.8 \mathrm{mg}, 43.1 \mu \mathrm{~mol}$, 0.90 equiv) in a $\mathrm{THF} / \mathrm{H}_{2} \mathrm{O}$ mixture ( $4 \mathrm{~mL}, 1: 1$ ). Column chromatography on silica ( $\mathrm{DCM} / \mathrm{MeOH} 98: 2$ to 94:6) afforded the desired compound $\mathbf{4}(42.0 \mathrm{mg}, 26.8 \mu \mathrm{~mol}, 56 \%)$ as a white solid.

The reaction mixture was stirred at room temperature for 24 h . The pH was adjusted to 6-7 with addition of ion-exchange resin (Amberlite IR $120 \mathrm{H}^{+}$). After filtration, the solvent was removed under vacuum with rotary evaporator and the residue was lyophilized to furnish desired de- $O$-acetylated compound $5(19.0 \mathrm{mg}, 17.9 \mu \mathrm{~mol}, 94 \%)$ as a white solid.

## NMR diffusion experiments

The measurement of the diffusion rate $(D)$ allows calculating the solvodynamic diameter of a molecule. ${ }^{1}$
The dendrimers are considered as spherical molecular objects, and characterized by an apparent diffusion coefficient $D$. The application of the Stokes-Einstein equation gives an estimate of the diameter of the molecule.

Stokes-Einstein equation:

$$
D=\mathrm{K}_{\mathrm{B}} \mathrm{~T} / 6 \pi \eta r_{s}
$$

$D$ : Diffusion rate ( $\mathrm{m}^{2} \cdot \mathrm{~s}^{-1}$ ); $\mathrm{K}_{\mathrm{B}}$ : Boltzmann's constant ( $k_{\mathrm{B}}=1.38 \times 10^{-23} \mathrm{~m}^{2} \cdot \mathrm{~kg} \cdot \mathrm{~s}^{-2} \cdot \mathrm{~K}^{-1}$ ); T: Temperature ( K ) ( $T=298.15 \mathrm{~K}$ ); $\eta$ : solvent viscosity in $\mathrm{Pa} \mathrm{s} ; r_{\mathrm{s}}$ : Solvodynamic radius of the species.
