## General Information

NMR spectra were recorded on a Bruker Avance DPX-400 instrument, equipped with a quadruple-band gradient probe (H/C/P/F QNP) or a Bruker Avance DRX-500 with a dual carbon/proton cryoprobe (CPDUL). ${ }^{13} \mathrm{C}$ and ${ }^{31} \mathrm{P}$ NMR spectra were registered with broad-band decoupling. The (+) and ( - ) designations represent positive and negative intensities of signals in ${ }^{13} \mathrm{C}$ DEPT-135 experiments.

GC-MS analyses were performed on a Shimadzu GC-2010 gas chromatograph interfaced to a Shimadzu GCMS 2010S mass selective detector, and equipped with an AOC-20i auto-injector and an AOC-20S auto-sampler tray ( 150 vials). $30 \mathrm{~m} \times 0.25 \mathrm{~mm} \times 0.25 \mu \mathrm{~m}$ capillary column, SHR5XLB, polydimethylsiloxane, $5 \% \mathrm{Ph}$ was employed. Helium ( $99.96 \%$ ), additionally purified by passing consecutively through a CRS oxygen/moisture/hydrocarbon trap (\#202839) and VICI oxygen/moisture trap (P100-1), was used as a carrier gas. The same model of gas chromatograph, equipped with the same auto-injector, FID detector, and J\&W CyclosilB column ( $30 \mathrm{~m} \times 0.25 \mathrm{~mm} \times$ $0.25 \mu \mathrm{~m}$ ) or J\&W CyclodexB column ( $30 \mathrm{~m} \times 0.25 \mathrm{~mm} \times 0.25 \mu \mathrm{~m}$ ) was employed for chiral GC analyses. Hydrogen gas was used as both carrier gas and FID fuel; zero-grade air and zero-grade nitrogen were used as an oxidant and make-up gas, respectively, for the FID. All these gases were purified by passing through CRS \#202839 traps.

Glassware employed in moisture-free syntheses was flame-dried in vacuum prior to use. Water was purified by dual stage deionization, followed by dual stage reverse osmosis. Anhydrous hexane, dichloromethane, and tetrahydrofuran were obtained by passing degassed HPLC-grade commercially available solvents consecutively through two columns filled with activated alumina (Innovative Technology). Anhydrous triethylamine was obtained by distillation of ACS-grade commercially available materials over calcium hydride in a nitrogen atmosphere. Glacial acetic acid was purchased form Acros Organics and used as received. Palladium complexes were obtained from Strem Chemicals. Preparations of starting materials, (4R)-2-[(1S,2S)-2-bromo-1-methylcyclopropyl]-4-phenyl-4,5-dihydro-1,3-oxazole (19) and (4S)-2-[(1S,2S)-2-bromo-1-methylcyclopropyl]-4-phenyl-4,5-dihydro-1,3-oxazole (24), as well as chiral ligands L1, L3 and L4 were previously disclosed in our preliminary communication. ${ }^{1}$ The same reference contains crystallographic data for $\mathrm{PdCl}_{2}(\mathbf{L} \mathbf{1})$ and $\mathrm{PdCl}_{2}(\mathbf{L} \mathbf{4})$ complexes.

## Synthesis of Chiral Phosphine Ligands

(4R)-2-[(1S,2S)-2-(Diphenylphosphino)-1-me-thylcyclopropyl]-4-phenyl-4,5-dihydro-1,3-oxazole (L2): To a stirred at $-80^{\circ} \mathrm{C}$ solution of ( $4 R$ )-

2-[(1S,2S)-2-bromo-1-methylcyclopropyl]-4-phenyl-4,5-dihydro-1,3-oxazole (19) (733 mg, 2.62 mmol ) in anhydrous THF ( 10 mL ) was added dropwise a solution of $n-\mathrm{BuLi}$ in hexane $(2.5 \mathrm{M}$, $1.2 \mathrm{~mL}, 3.0 \mathrm{mmol}$ ). The mixture was allowed to warm up to $-30^{\circ} \mathrm{C}$ (within 0.5 h ), after which diphenylchlorophosphine ( $556 \mu \mathrm{~L}, 684 \mathrm{mg}, 3.1 \mathrm{mmol}$ ) was added dropwise, and the resulting mixture was stirred for 30 min at room temperature. The mixture was quenched with saturated aqueous solution of $\mathrm{NH}_{4} \mathrm{Cl}(30 \mathrm{~mL})$, and extracted with ether ( $3 \times 15 \mathrm{~mL}$ ). The combined ethereal phases were washed with brine, dried with $\mathrm{MgSO}_{4}$ and concentrated. ${ }^{2}$ Purification of the final product by preparative column chromatography was performed in a nitrogen-filled glove box using degassed silica gel and $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{EtOAc}(40: 1)$ as an eluent. Yield $200 \mathrm{mg}(0.52 \mathrm{mmol}, 20 \%)$.
