## General information

Reactions were generally performed under inert atmosphere (argon) in flame-dried flasks. Solvents and reagents were added by syringe. Solvents were dried using standard procedures and were purified with a MB SPS-800-dry solvent system. Triethylamine was distilled from $\mathrm{CaH}_{2}$ and stored over KOH under argon atmosphere. Commercial available reagents were used as received without further purification unless otherwise stated. Products were purified by flash chromatography on silica gel (230-400 mesh, Merck or Fluka) or by size exclusion chromatography (Sephadex ${ }^{\text {TM }}$ LH-20, GE Healthcare). Unless otherwise stated, yields refer to analytical pure samples. Hydrogenolyses were performed with hydrogen from Air Liquide (Alphagaz 2). TLCanalyses were performed on silica gel coated aluminium plates purchased from Merck. Products were detected by UV-activity and by using staining reagents (Cer/molybdenum reagent, $\mathrm{KMnO}_{4}$ and ninhydrine). NMR spectra were recorded on BRUKER (AV 500, AV 700) and JEOL (ECP 500) instruments. Chemical shifts ( $\delta$ ) are listed in parts per million (ppm) and are reported relative to solvent residual signals: $\mathrm{CDCl}_{3}\left({ }^{1} \mathrm{H}: \delta=7.26 \mathrm{ppm}\right.$, $\left.{ }^{13} \mathrm{C}: \delta=77.16 \mathrm{ppm}\right), \mathrm{CD}_{3} \mathrm{OD}\left({ }^{1} \mathrm{H}: \delta=3.31 \mathrm{ppm},{ }^{13} \mathrm{C}: \delta=49.00 \mathrm{ppm}\right)$ or pyridine- $\mathrm{d}^{5}\left({ }^{1} \mathrm{H}: \delta\right.$ $\left.=8.74 \mathrm{ppm},{ }^{13} \mathrm{C}: \delta=150.35 \mathrm{ppm}\right)$. Integrals are in accordance with assignments; coupling constants $(\mathcal{J})$ are given in Hz . All ${ }^{13} \mathrm{C}$ NMR spectra are proton-decoupled. Multiplicity is indicated as follows: $s$ (singlet), $\mathrm{sbr}_{\mathrm{br}}$ (broad singlet), d (doublet), t (triplet), q (quartet), dd (doublet of doublet), dt (doublet of triplet), td (triplet of doublet), m (multiplet), $\mathrm{m}_{\mathrm{c}}$ (centered multiplet). For detailed peak assignments 2D spectra were measured (COSY and HMQC). The given ratios of diastereomers were calculated by comparison of the $2^{\prime}-\mathrm{H}$ peaks. IR spectra were measured with a Jasco spectrometer (FT/IR-4100 with DLATGS Detector). HRMS analyses were performed with Agilent 6210
(ESI-TOF, $10 \mu \mathrm{~L} / \mathrm{min}, 1.0$ bar, 4 kV ) and Varian/Agilent Ionspec QFT-7 (ESI-FTICR, 4 $\mu \mathrm{L} / \mathrm{min}, 1.0$ bar, 4 kV ) instruments. Elemental analyses were carried out with instruments from PerkinElmer (CHN-Analyzer 2400) and from Elementar (Vario, Vario EL, Vario EL III). Melting points were measured with a Reichert apparatus (Thermovar) and are uncorrected.

## (S)-1-[(R)-2-(4'-Bromophenyl)-1',3'-dioxolan-4-yl]ethane-1,2-diol (8)

Under an argon atmosphere, lithium aluminum hydride ( $3.21 \mathrm{~g}, 84.6 \mathrm{mmol}$ ) was suspended in dry THF (525 mL) at $0^{\circ} \mathrm{C}$. Ester $7(21.6 \mathrm{~g}, 65.1 \mathrm{mmol})$, dissolved in dry THF (220 mL) , was dropwise added to the lithium aluminum hydride suspension. After 1 $h$ stirring at rt , the solution was cooled to $0^{\circ} \mathrm{C}$ and slowly quenched with water ( 30 mL ). Then, $20 \%$ aq. NaOH solution ( 22 mL ) and water ( 37 mL ) were added and the suspension was stirred for further 4 h at rt . The suspension was filtered through a pad of Celite ${ }^{\circledR}$. The filtrate was extracted with diethyl ether ( $3 \times 500 \mathrm{~mL}$ ) and the combined organic layers were dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and the solvent was removed in vacuo. The crude product was purified by column chromatography (silica gel, hexanes/EtOAc $1: 3)$ to yield 8 (18.8 g, quant.) as a colorless solid.

The obtained two diastereomers (d.r. 52:48) were not separated.

The crude product was dissolved in dichloromethane ( 180 mL ) and $N$-benzylhydroxylamine $(9.30 \mathrm{~g}, 75.5 \mathrm{mmol})$ and magnesium sulfate $(10.8 \mathrm{~g})$ were added. The suspension was stirred over night at rt, filtered and the solvent was removed in vacuo. The crude product was purified by column chromatography (silica gel, hexanes/EtOAc 1:1) to yield 6

## $p$-Terphenyl derivatives 30 and 31 :

A suspension of $\mathrm{Pd} / \mathrm{C}(10 \% \mathrm{Pd}, 200 \mathrm{mg})$ and $\mathrm{iPrOH}(3 \mathrm{~mL})$ was saturated with hydrogen for 15 min . Compound 27 ( $100 \mathrm{mg}, 80.5 \mu \mathrm{~mol}$ ) and TFA ( $23 \mathrm{mg}, 0.02 \mathrm{~mL}, 0.201 \mathrm{mmol}$ ) were dissolved in hexafluoro-2-propanol ( 2 mL ) and added to the suspension. The mixture was stirred for 8 h under hydrogen pressure (balloon), then filtered through Celite ${ }^{\circledR}$ and the solvents were removed in vacuo. Under an argon atmosphere the crude product was dissolved in degassed $\mathrm{MeOH}(1 \mathrm{~mL})$ and a samarium(II) iodide solution ( 0.1 m in THF, $4.83 \mathrm{~mL}, 0.483 \mathrm{mmol}$ ) was added dropwise. The mixture was stirred for 30 min at rt and then for another 10 min in the presence of air. A size exclusion chromatography (Sephadex ${ }^{\text {TM }} \mathrm{LH}-20, \mathrm{CH}_{3} \mathrm{OH}$ ) of the mixture and subsequent purification by thin-layer chromatography (silica gel, $\mathrm{CH}_{2} \mathrm{Cl}_{2}: \mathrm{MeOH}, 7 \mathrm{~N} \mathrm{NH}_{3}$ ) afforded $\mathbf{3 0}$ ( $25 \mathrm{mg}, 54 \%$ ) and 31 ( $20 \mathrm{mg}, 37 \%$ ) as a yellow solid.
