## 1 General remarks

All the reactions were carried out in oven-dried glassware and all commercially available reagents were used without further purification. Dichloromethane and acetonitrile used for the reaction were distilled using calcium hydride under nitrogen prior to use. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra (TMS used as internal standard) were recorded at ambient temperature at $300 \mathrm{MHz}, 75 \mathrm{MHz}$ respectively in $\mathrm{CDCl}_{3}$ with a Bruker ARX300 spectrometer. High resolution mass spectra for all the new compounds were done by a Micro mass Q-Tof instrument (ESI). Analytical thin-layer chromatography (TLC) was performed using 0.25 mm precoated silica gel plates and the compounds were visualized with UV light ( $\lambda=254 \mathrm{~nm}$ ). Compounds were purified using flash column chromatography on silica gel (200-300mesh).

## 2 General procedure for one-pot synthesis of $\boldsymbol{\alpha}, \boldsymbol{\beta}$-diamino esters

Into a dry vial was added cinnamic ester $4(0.50 \mathrm{mmol})$ and freshly distilled acetonitrile ( 3.0 mL ). The reaction vial was loaded with freshly activated $4 \AA$ molecular sieves $(250 \mathrm{mg}), \mathrm{TsNCl}_{2}(1.0 \mathrm{mmol})$ and $\mathrm{Cu}(\mathrm{OTf})_{2}(10 \mathrm{~mol} \%)$. The solution in the capped vial was stirred at room temperature for 24 h without argon protection. The reaction was finally quenched by dropwise addition of saturated aqueous $\mathrm{Na}_{2} \mathrm{SO}_{3}$ solution ( 3.0 mL ). After quenching for 30 min , benzylamine ( 2.0 mL ) was added to the mixture exposed to air. Another hour was needed until conversion was complete. Then the phases were separated, and the aqueous phase was extracted with ethyl acetate $(3 \times 10 \mathrm{~mL})$. The combined organic layers were washed with brine, dried over anhydrous sodium sulfate, and concentrated to dryness. Purification by flash chromatography (EtOAc/hexane, from1:20 to 1:3, v/v) provided final products 5.

## 3 General procedure for ring-opening of aziridine 6

Into a solution of prepared aziridine $\mathbf{6}(0.5 \mathrm{mmol})$ in dry $\mathrm{CH}_{3} \mathrm{CN}(4.0 \mathrm{~mL})$ was added benzylamine ( 5.0 mmol ) in an ice bath. Then the temperature was raised to room temperature and the reaction mixture was maintained at rt for another 3 h , resulting in complete conversion. After being concentrated under reduced pressure, the residue was purified via column chromatography with ethyl acetate and petroleum ether (from 1:10 to $1: 3 \mathrm{v} / \mathrm{v}$ ) as eluent to give compound $\mathbf{5 b}$.
