1. General

$^1$H and $^{13}$C NMR spectra were recorded on JEOL ECA-600P ($^1$H 600 MHz, $^{13}$C 150 MHz). Chemical shifts are reported using the methine signal of CHCl$_3$ at $\delta$ 7.26 ($^1$H NMR) and $\delta$ 77.0 ($^{13}$C NMR) as internal standards. MALDI-TOF mass spectra were recorded on Bruker ultraflex III spectrometer. Analytical and Preparative gel permeation chromatography were performed on Shodex GPC-101 (an eluent: THF) and Japan Analytical Industry LC-918 (an eluent: CHCl$_3$) respectively. SEC-MALLS measurements were performed on SEC (Jasco PU-980 precision pump and RI-930 refractive index detector) coupled with a Dwan E instrument (Wyatt Technology; Ga-As laser, $\lambda$ = 690 nm, an eluent: DMF containing 10 mM LiBr). Unless otherwise noted, all materials were obtained from commercial suppliers and used without further purification. Dichloromethane was washed with water, distilled from P$_2$O$_5$, redistilled from dried K$_2$CO$_3$ to remove a trace amount of acid, and stored over molecular sieves 4A. Supporting electrolyte Bu$_4$NB(C$_6$F$_5$)$_4$ was prepared from commercially available NaB(C$_6$F$_5$)$_4$ according to the reported procedure [1].

2. Synthesis of dendrimer with peripheral bromo groups 4

Compound 2 was prepared according to the procedure reported in the literature [2]. To a solution of 4,4-di bromobenzhydrol 1 (0.976 g, 2.85 mmol) in dichloromethane (7 mL) was added thionyl chloride (2.0 mL, ca. 28 mmol) dropwise at 0 °C, and the mixture was stirred at room temperature for overnight. The solvent was removed under reduced pressure, and the residue was extracted with ethyl acetate. The organic layer was washed with brine and dried on anhydrous MgSO$_4$. The solvent was removed under reduced pressure to afford the desired product 2 (0.989 g, quant), which was used for the next step without further purification.

Compound 2 (0.90 g, 2.5 mmol), trimethylsilyldiphenylmethane 3 [3] (0.22 g, 0.91 mmol) were dissolved in BF$_3$ • OEt$_2$ (2.19 g, 15.4 mmol). After stirring for 24 h at 65 °C, the reaction was treated with iced water and extracted with AcOEt and dried over MgSO$_4$. After evaporation of the solvent, the crude product was purified with flash chromatography followed by reprecipitation from hexane to obtain 4 (689 mg, 86%). $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ 7.39 (d, $J$ = 8.4 Hz, 8H), 7.14 (d, $J$ = 8.0 Hz, 4H), 6.91-6.95 (m, 12H), 5.38 (s, 2H), 3.45 (s, 1H), -0.01 (s, 9H). $^{13}$C NMR (150 MHz, CDCl$_3$) $\delta$ 142.57, 147.56, 141.2, 139.3, 130.5, 130.1, 129.4, 120.4, 55.2, 45.3, -1.8. In the cathodic chamber were placed trifluoromethanesulfonic acid (70 μL, 0.80 mmol) and 0.3 M Bu4NBF4/CD2Cl2 (5.0 mL). The constant current electrolysis (5.0 mA) was carried out at -78 °C with magnetic stirring. After 2.5 F/mol of electricity was consumed, the reaction mixture of the anodic chamber was transferred to a 5 mm φ NMR tube with a septum cap under Ar atmosphere at -78 °C.
