## General experimental methods

All reactions were carried out in dried glassware under an inert atmosphere (argon) in anhydrous solvents using standard syringe and septa techniques. The solvents used for chromatography were distilled prior to use. All other solvents and reagents were purchased from commercial suppliers and were used without further purification. TLC experiments were carried out on aluminum sheets coated with silica gel $60 \mathrm{~F}_{254}$ and spots were visualized with UV-light (254 nm) and developed with Seebach's reagent or $p$-anisaldehyde and heating. Column chromatography was carried out on silica gel (32-63 $\mu \mathrm{m}, 60 \AA, 230-400$ mesh). Melting points were determined with a Dr. Tottoli apparatus and are uncorrected. NMR spectra were recorded with a 300, 400 and 500 MHz spectrometer. The spectra were measured in $\mathrm{CDCl}_{3}$ or DMSO- $d_{6}$ at ambient temperature unless otherwise stated and the chemical shifts were referenced to the residual solvent signal $\left(\mathrm{CDCl}_{3}: \delta \mathrm{H}=7.26 \mathrm{ppm}, \delta \mathrm{C}=77.16 \mathrm{ppm} ; \mathrm{DMSO}-\mathrm{d}_{6}: \delta \mathrm{H}=\right.$ $2.50 \mathrm{ppm}, \delta \mathrm{C}=39.52 \mathrm{ppm})$. IR spectra were recorded on routine FTIR spectrometers using a diamond ATR unit or a NaCl pellet. For high resolution FAB MS (FAB-HRMS), PEG 300 or PEG 600 was used as internal standard. ESI-HRMS spectra were recorded on a Q-TOF instrument with a dual source and a suitable external calibrant. Microwave reactions were carried out in a CEM Discover instrument.

The cyanopyrrolines 6a-j were prepared according to the literature from commercially available aminoacetonitrile hydrochloride and chalcones [1].

## General procedures

General procedure A: synthesis of 2,4-disubstituted pyrroles 7a-i: A solution of cyanopyrrolines 6a-i in dichloromethane was transferred into a microwave reaction vessel. After removing the solvent in vacuo, the vessel was flushed with argon and closed with a cap. It was irradiated for $30 \mathrm{~min}\left(\mathrm{P}_{\max } 180 \mathrm{~W}\right)$ in a monomode microwave apparatus under air cooling. The temperatures reached (IR sensor) are listed in Table S1. The pressurized vessel was opened very carefully inside a wellventilated hood (caution, hydrogen cyanide!) and the residue was purified by column chromatography.

| 9 | $\mathbf{7 i}$ | 250 | 160 |

General procedure B: synthesis of pyrrole-2-carbonitriles 10a-j: A round bottomed flask equipped with a magnetic stir bar was charged with cyanopyrroline 6a-j and DDQ (1.15-1.20 equiv) in toluene ( $15-20 \mathrm{~mL} / \mathrm{mmol} 6$ ). The reaction mixture was stirred under reflux until the starting material was consumed (TLC, 2-4 h). It was diluted with ethyl acetate and washed with $10 \%$ aqueous NaOH . The extracts were
dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo to obtain the crude product which was purified by column chromatography.
