## Experimental data, NMR and ESI mass spectra

- Experimental part
- NMR spectra of compounds 1, 2, 3, 21, 22 and 6 and the metal complexes of 1, 2, 3, 14, and 22.
- Mass spectra of metal complexes of 1,2,14, and 22.

## Experimental

General remarks: All solvents were distilled and dried prior to use according to standard procedures. All syntheses with air- and moisture-sensitive compounds were performed using Schlenk techniques under argon atmosphere. Column chromatography was performed on silica gel $60 \mathrm{M}(0.04-0.063 \mathrm{~mm})$ from MachereyNagel. All solvents used as eluents for column chromatography were distilled prior to use. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded at 293 K on a Bruker AM $300\left({ }^{1} \mathrm{H}: 300.1\right.$ $\mathrm{MHz},{ }^{13} \mathrm{C}: 75.5 \mathrm{MHz}$ ) or a Bruker AM $400\left({ }^{1} \mathrm{H}: 400.1 \mathrm{MHz},{ }^{13} \mathrm{C}: 100.6 \mathrm{MHz}\right) .{ }^{1} \mathrm{H}$ NMR chemical shifts are reported on the $\delta$ scale (ppm) relative to residual non-deuterated solvent as internal standard. ${ }^{13} \mathrm{C}$ NMR chemical shifts are given as $\delta$ values (ppm) relative to signals of the deuterated solvent as internal standards. Mass spectra were taken on a Bruker autoflex II TOF/TOF (MALDI) or a Bruker micrOTOF-Q (ESI, Hi-Res-ESI). Elemental analyses were carried out on a Heraeus Vario EL. Chemicals and reagents (except for the solvents) obtained from commercial sources were used as received. The following compounds were prepared according to published procedures: pyrrole-substituted 2-halogenopyridines 6 and $7,{ }^{[1]}$ bis(pyrrole)substituted 2,2'-bipyridines 8 and $\mathbf{9}^{[1]}$ as well as $\mathbf{1 0}^{[2]}$, diamino-2,2'-bipyridines 11 $13^{[1]}$, diisothiocyanato-2,2'-bipyridines $14-16^{[3]}$, $6^{A}$-O-p-toluenesulfonyl- $\beta$-cyclodextrin (18) ${ }^{[4]}$, $6^{\mathrm{A}}$-azido-6 ${ }^{\mathrm{A}}$-deoxy- $\beta$-cyclodextrin (19) ${ }^{[5]}$, $2^{\mathrm{A}}, 2^{\mathrm{B}}, 2^{\mathrm{C}}, 2^{\mathrm{D}}, 2^{\mathrm{E}}, 2^{\mathrm{F}}, 2^{\mathrm{G}}, 3^{\mathrm{A}}, 3^{\mathrm{B}}, 3^{\mathrm{C}}, 3^{\mathrm{D}}, 3^{\mathrm{E}}, 3^{\mathrm{F}}, 3^{\mathrm{G}}, 6^{\mathrm{B}}, 6^{\mathrm{C}}, 6^{\mathrm{D}}, 6^{\mathrm{E}}, 6^{\mathrm{F}}, 6^{\mathrm{G}}$-icosa-O-acetyl- $6^{\mathrm{A}}$-azido-

amino- $\mathbf{6}^{\mathrm{A}}$-desoxy- $\beta$-cyclodextrin (21): $3.92 \mathrm{~g}(1.96 \mathrm{mmol})$ of peracetylated azidocyclodextrin 20 were dissolved in 12 mL of dry acetone and $1.03 \mathrm{~g}(3.95 \mathrm{mmol})$ $\mathrm{PPh}_{3}$ were added. The reaction mixture was stirred for two hours at rt, followed by the addition of 1 mL of water. After 30 minutes of reflux, the solvents were evaporated, the crude product was dissolved in dichloromethane and washed with water. After drying with $\mathrm{MgSO}_{4}$, the solvents were evaporated. Further purification could be achieved by column chromatography on silica gel (eluent: dichloromethane/EtOH $96: 4+0.5 \% \mathrm{NEt}_{3}, R_{\mathrm{f}}=0.32$ ) to give $2.34 \mathrm{~g}(1.18 \mathrm{mmol}, 60 \%)$ of the desired product as a white solid.

Crystal structure determination: The data collection was performed on a NONIUS KappaCCD diffractometer (area detector) using graphite monochromated Mo $K_{\alpha}$ radiation $(\lambda=0.71073 \AA$ A $)$. The diffractometer was equipped with a low-temperature device (Cryostream 600er series, Oxford Cryosystems, 123(2) K). Intensities were measured by fine-slicing $\omega$ and $\varphi$-scans and corrected for background, polarization and Lorentz effects.

An empirical absorption correction was applied for all data sets according to Blessing's method. ${ }^{[13]}$ The structures were solved by direct methods and refined anisotropically by the least-squares procedure implemented in the SheIX program system. ${ }^{[14]}$ Hydrogen atoms were included isotropically using the riding model on the bound carbon atoms.
