## Experimental and analytical data

## General

Melting points were recorded on a Buchi apparatus. Infrared (IR) spectra were recorded on a Nicolet Impact-400 FT IR spectrometer in $\mathrm{KBr} / \mathrm{CHCl}_{3} .{ }^{1} \mathrm{H}$ NMR ( 400 MHz ), ${ }^{13} \mathrm{C}$ NMR ( 100 MHz ) spectral data were obtained at rt on Bruker (AVANCE IIITM) 500 MHz and Bruker (AVANCE IIITM) 400 MHz spectrometers with tetramethylsilane (TMS) as an internal standard and in $\mathrm{CDCl}_{3}$ solution. Coupling constants ( $J$ values) are given in Hertz (Hz). Highresolution mass spectrometric (HRMS) measurements were carried out using Bruker (Maxis Impact) or Micromass Q-ToF spectrometers. Analytical thin layer chromatography (TLC) was performed on ( $10 \times 5 \mathrm{~cm}$ ) glass plates coated with Acme's silica gel GF 254 (containing $13 \%$ calcium sulfate as a binder). Chromatography was performed using Acme's silica gel (100-200 mesh) using double spray bellows for application of pressure and the column is eluted with ethyl acetate-petroleum ether mixture. All of the organic solvents used in this study were dried over appropriate drying agents and distilled prior to use.

## General procedure for the preparation of diindole derivatives.

In a typical experiment, 1.5 g of an L-(+)-tartaric acid $/ N, N^{\prime}$-dimethylurea (30:70) mixture was heated to $70{ }^{\circ} \mathrm{C}$ to obtain a clear melt. To this melt, 2 mmol of $N$-methyl- $N$-phenylhydrazine and 1 mmol of diketone were added at $70^{\circ} \mathrm{C}$. After termination of the reaction (TLC monitoring by mini work up), the reaction mixture was quenched with water while it was still hot. The reaction mixture was cooled to rt and the solid was filtered through a sintered glass funnel and washed with water $(2 \times 5 \mathrm{~mL})$. The solvent was evaporated and the crude product was purified by silica gel column chromatography with an appropriate mixture of EtOAc and petroleum ether [1,2].

## Synthesis of compound 8

The tricyclic dione 2 ( $100 \mathrm{mg}, 0.56 \mathrm{mmol}$ ), was reacted with phenylhydrazine hydrochloride ( $177 \mathrm{mg}, 1.23 \mathrm{mmol}$ ) by following the general procedure. After termination of the reaction (TLC monitoring), the reaction mixture was worked up according to the general procedure. The crude product obtained was purified by column chromatography on silica gel
(EtOAc/petroleum ether, 10:90) to provide the diindole derivative 8 ( $115 \mathrm{mg}, 62 \%$ ) as a colourless solid [2].
