## Experimental and analytical data

General experimental methods. Reactions were carried out under argon atmosphere unless otherwise indicated. The solvents were purified prior to use: THF, diethyl ether and toluene were distilled from sodium/benzophenone, dichloromethane and acetonitrile were distilled from calcium hydride. The reactions were monitored with the aid of thin-layer chromatography (TLC) on 0.25 mm precoated silica gel plates. Visualization was carried out with UV light and aqueous ceric ammonium molybdate solution or potassium permanganate stain. Flash column chromatography
was performed with the indicated solvents on silica gel 60 (particle size 0.040-0.063 $\mathrm{mm}) .{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a 300 and a 500 MHz spectrometer, respectively. Chemical shifts are given in $\mathrm{ppm}(\delta)$, with reference to the residual proton resonances of the solvents. Coupling constants $(\mathcal{J})$ are given in Hertz $(\mathrm{Hz})$. The letters $\mathrm{m}, \mathrm{s}, \mathrm{d}, \mathrm{t}$, and q stand for multiplet, singlet, doublet, triplet and quartet, respectively. The letters br indicate that the signal is broad. Starting dienes $\mathbf{2 a}$ [1], $\mathbf{2 b}$ [2], 2c [3], 2d [2] and $\mathbf{2 e}$ [4] were previously described.

Preparation of starting substrates 8, method A. Homoallylbenzylamine 7 (1.0 mmol ) was added to a mixture of the corresponding carboxylic acid 5 ( 1.0 mmol ), $\mathrm{EDCI}(1.5 \mathrm{mmol}), \mathrm{HOBt}(2.0 \mathrm{mmol})$ and triethylamine $(2.0 \mathrm{mmol})$ in DCM ( 0.10 M ). The mixture was stirred overnight at rt . The reaction mixture was then hydrolysed with $\mathrm{H}_{2} \mathrm{O}(20 \mathrm{~mL})$ and extracted with DCM $(3 \times 15 \mathrm{~mL})$. Collected organic fractions were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and, after removal of the solvents the crude reaction mixture was purified by flash chromatography.

Method B. Homoallyl benzyl amine 7 ( 2.3 mmol ) was dissolved in DCM ( 3.6 mL ) and pyridine ( 3.0 mmol ) and cooled to $0^{\circ} \mathrm{C}$. A solution of the corresponding acyl chloride 6 ( 3.0 mmol ) in DCM ( 1.0 mL ) was then syringed dropwise into the reaction. The resulting reaction mixture was stirred at room temperature for 3 hours. The reaction was then diluted with $\mathrm{DCM}(10 \mathrm{~mL})$, quenched with sat $\mathrm{NaHCO}_{3}(20 \mathrm{~mL})$, extracted with DCM ( $3 \times 20 \mathrm{~mL}$ ), dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated in vacuum. The crude product was purified through flash chromatography to afford the title compound.

## (E)-N-Benzyl-N-(3-butenyl)-2-butenamide (8a)

Amide 8a was obtained in 49\% yield (colourless oil) from (E)-2-butenoic acid 5a as a mixture of rotamers following method $\mathrm{A} .{ }^{1} \mathrm{H}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta 1.84(\mathrm{~d}, \mathrm{~J}=$
