## 1. Experimental procedures

NMR spectra were recorded on a Bruker AV II-300 (300 MHz for ${ }^{1} \mathrm{H}, 75 \mathrm{MHz}$ for ${ }^{13} \mathrm{C}$ ), a Bruker DRX 400 or a Bruker AV III-400 (400 MHz for ${ }^{1} \mathrm{H}, 100 \mathrm{MHz}$ for ${ }^{13} \mathrm{C}, 376 \mathrm{MHz}$ for ${ }^{19} \mathrm{~F}$ ) and a Bruker AV-II $600\left(600 \mathrm{MHz}\right.$ for ${ }^{1} \mathrm{H}, 150 \mathrm{MHz}$ for ${ }^{13} \mathrm{C}$ ) spectrometer at 299 K. Chemical shifts are given in ppm ( $\delta$ scale) and referenced to TMS or the residual solvent peak. For all compounds, assignments of NMR chemical shifts are based on 2D NMR experiments, which always included COSY, HSQC, and HMBC spectra. ${ }^{13} \mathrm{C}$ NMR chemical shifts are normally given with one decimal, unless two clearly separated signals would give identical shift values. Mass spectra were obtained with a LTQ Orbitrap Velos, a Thermo Finnigan LTQ FT, a Thermo Finnigan MAT95 and a Finnigan MAT 95 XLT. GC-MS was performed on an Agilent Technologies 6890 gas chromatograph using a Phenomenex ZB5-MS $0.25 \mu \mathrm{~m}$ column (internal diameter: 0.25 mm , length: 30 m ) and a JMST100GC (GCAccuTOF, JEOL, Japan) apparatus at 70 eV (EI). IR spectra were recorded on a Bruker Tensor 27 spectrometer with diamond ATR, wave numbers are given in $\mathrm{cm}^{-1}$. UV-vis spectra were measured with a Varian Cary 100 Bio UV-vis spectrometer, wavelengths are given in nm. Melting points were measured with a Büchi 530 melting point apparatus and are uncorrected. Chemicals were purchased from commercial suppliers and used without further purification. Solvents were dried prior to use using standard methods unless noted. Flash column chromatography was performed on Merck silica gel $60(40-63 \mu \mathrm{~m})$. Thin-layer chromatography (TLC) was done on Merck silica gel $60 \mathrm{~F}_{254}$ and Merck silica gel 60 RP-18 $\mathrm{F}_{254 \mathrm{~s}}$ aluminum sheets. HPLC separation was carried out with a Merck Hitachi intelligent pump. The following abbreviations have been used: DMAC (dimethylacetamide), PE (petrol ether), EA (ethyl acetate), TBME (tert-butyl methyl ether), HV (high vacuum).

6-lodoindole (4): Starting material 3 ( $5.00 \mathrm{~g}, 19.0 \mathrm{mmol}, 1.0$ equiv) was dissolved in DMF ( 50 mL ). DMFDMA ( $3.05 \mathrm{~mL}, 22.8 \mathrm{mmol}$, 1.2 equiv) was added, followed by pyrrolidine ( $1.90 \mathrm{~mL}, 23.1 \mathrm{mmol}$, 1.2 equiv). The mixture was heated to $110^{\circ} \mathrm{C}$ for 4 h until complete consumption of starting material as monitored by TLC, and allowed to cool to rt. DMF ( 100 mL ) and 4 m aqueous $\mathrm{NH}_{4} \mathrm{OAc}$ buffer ( $83 \mathrm{~mL}, 17.5$ equiv) were added and the solution was cooled with an ice bath. An aqueous solution of $20 \% \mathrm{TiCl}_{3}$ in $3 \% \mathrm{HCl}(73.3 \mathrm{~mL}$, $114.06 \mathrm{mmol}, 6.0$ equiv) was added via a dropping funnel. The reaction mixture was stirred for 3 h followed by extraction with TBME $(3 \times 100 \mathrm{~mL})$. The organic phase was washed with $2 \mathrm{M} \mathrm{NaOH}(100 \mathrm{~mL}), \mathrm{H}_{2} \mathrm{O}$ ( 100 mL ) and dried with $\mathrm{MgSO}_{4}$. After evaporation of the solvent the raw material was prepurified by short column chromatography [PE/EA (15:1)] to be sublimated in HV at $110-115^{\circ} \mathrm{C}$ to give the product as a slightly yellowish solid $(2.83 \mathrm{~g}, 11.6 \mathrm{mmol}$, $61 \%)$. Bisindoles 6, 7, 8, and 9: Samarium powder ( $\sim 60$ mesh, $358 \mathrm{mg}, 2.38 \mathrm{mmol}$, 4.4 equiv) was dispersed in dry THF ( 10 mL ) under argon. Diiodoethane ( $\sim 800 \mathrm{mg}$ ) was dissolved in TBME ( 30 mL ) and washed with sat. $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}(30 \mathrm{~mL})$. The organic
phase was dried with $\mathrm{MgSO}_{4}$, evaporated and dried under high vacuum to afford diiodoethane as a colorless solid. The purified diiodoethane ( $609 \mathrm{mg}, 2.16 \mathrm{mmol}$, 4.0 equiv) was added to the samarium dispersion and the mixture was stirred for 2.5 h at room temperature. The color changed to dark blue. The mixture was cooled to $-78{ }^{\circ} \mathrm{C}$ and ketone $5(100 \mathrm{mg}, 0.54 \mathrm{mmol}, 1.0$ equiv) in dry THF ( 2 mL ) was slowly added via a syringe pump within 30 min . Afterwards the mixture was allowed to warm to $4^{\circ} \mathrm{C}$ within 15 h and quenched with $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$. TBME ( 5 mL ) and brine ( 30 mL ) were added and the aqueous phase was further extracted with TBME ( 20 mL ). Bisindoles 15 and 16: Samarium powder ( $357 \mathrm{mg}, 2.38 \mathrm{mmol}, 4.4$ equiv) was put under HV and flushed with argon several times in a pre-dried Schlenk flask. Dry THF $(10 \mathrm{~mL})$ from a glove box was added. Diiodoethane ( $609 \mathrm{mg}, 2.16 \mathrm{mmol}, 4.0$ equiv), which had been washed as above with a sat. $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ solution, was added in one portion. A vacuum was applied carefully to the mixture to remove traces of oxygen (until gas evolution from THF). After stirring for 2 h the now dark blue reaction mixture was cooled to $-78{ }^{\circ} \mathrm{C}$ and the $\alpha, \beta$-unsaturated ketone $14(108 \mathrm{mg}, 0.54 \mathrm{mmol}, 1.0$ equiv) in THF ( 2 mL ) was added via a syringe pump within 30 min . The mixture was warmed to $3^{\circ} \mathrm{C}$ within 15 h and then $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$ was added to quench the reaction (TLC showed complete consumption of the starting material). The mixture was diluted with TBME ( 50 mL ) and washed with brine $(30 \mathrm{~mL})$. The aqueous phase was extracted with TBME $(20 \mathrm{~mL})$. Chloromethyltriphenylphosphonium chloride ( $118 \mathrm{mg}, 0.34 \mathrm{mmol}, 2.2$ equiv) and unsaturated ketone 24 ( $30 \mathrm{mg}, 0.16 \mathrm{mmol}, 1.0$ equiv) were dried under high vacuum in separate Schlenk flasks. The phosphonium salt was suspended in THF ( 2 mL ). After cooling to $0{ }^{\circ} \mathrm{C}$ a 1.9 m solution of PhLi in $\mathrm{Bu}_{2} \mathrm{O}(190 \mu \mathrm{~L}, 0.35 \mathrm{mmol}, 2.2$ equiv) and a 1 m solution of LiBr in THF ( $350 \mu \mathrm{~L}, 0.35 \mathrm{mmol}$, 2.2 equiv) were added at the same time. The mixture was warmed to rt . The phosphonium salt did not dissolve completely and further PhLi ( $40 \mu \mathrm{~L}, 0.08 \mathrm{mmol}$, 0.5 equiv) was added but the solid still did not dissolve. The mixture was cooled to $-78^{\circ} \mathrm{C}$ and the unsaturated ketone 24 in THF ( 2 mL ) was added dropwise. The reaction mixture turned turbid and was warmed to rt and again cooled to $-78^{\circ} \mathrm{C}$ (stirring for 5 min at each temperature). At $-78{ }^{\circ} \mathrm{C}$ a second portion of PhLi ( $190 \mu \mathrm{~L}, 0.36 \mathrm{mmol}, 2.3$ equiv) and $\mathrm{LiBr}(350 \mu \mathrm{~L}$, $0.35 \mathrm{mmol}, 2.2$ equiv) was added and the reaction mixture was stirred for 15 min , warmed to rt ( 15 min stirring) and again cooled to $-78^{\circ} \mathrm{C}$ ( 15 min stirring). At this temperature a 2 m solution of HCl in $\mathrm{Et}_{2} \mathrm{O}(160 \mu \mathrm{~L}, 0.32 \mathrm{mmol}, 2.0$ equiv) was added dropwise and the solution was almost completely decolorized. KOt - Bu ( 23 mg , $0.19 \mathrm{mmol}, 1.2$ equiv) was added in one portion and the reaction was warmed to rt. After stirring for 1 h the TLC showed complete consumption of the starting material. The mixture was diluted with TBME $(10 \mathrm{~mL})$ and quenched with $\mathrm{H}_{2} \mathrm{O}(5 \mathrm{~mL})$. TMBE $(10 \mathrm{~mL})$ was added and the organic phase was washed with $\mathrm{H}_{2} \mathrm{O}(50 \mathrm{~mL})$ followed by extraction of the aqueous phase with TBME (10 mL).
