## Experimental procedures, characterization and spectral data for synthesized compounds 11-64

## General

NMR spectra were recorded with a Bruker Avanve-400 spectrometer $\left({ }^{1} \mathrm{H}\right.$ at $400 \mathrm{MHz},{ }^{13} \mathrm{C}$ at 100.6 MHz) in $\mathrm{CDCl}_{3}$ or DMSO- $d_{6}$ at 298 K . Chemical shifts are given in $\delta$ scale in ppm, signals in proton spectra are referenced to residual peaks of $\mathrm{CHCl}_{3}$ or $\mathrm{CHD}_{2}$ in DMSO ( $\delta_{\mathrm{H}} 7.25,2.49$, respectively), signals in ${ }^{13} \mathrm{C}$ spectra are referenced to the centers of multiplets $\mathrm{CDCl}_{3}$ or $\left(\mathrm{CD}_{3}\right)_{2} \mathrm{SO}$ ( $\delta_{\mathrm{c}} 77.0$, 39.5, respectively). MALDI-TOF mass spectra of positive ions were registered with a Bruker Daltonics Autoflex II spectrometer using 1,8,9-trihydroxyanthracene (dithranol) as a matrix and PEG-200, 300, 400 or 600 as internal standards for a precise calibration. Elemental analysis was done using Vario Micro Cube Elementar device, melting points were measured with Electrothermal device in a open capillary. Preparative column chromatography was carried out using silica gel Merck 40-60 mesh.

Commercially available diamines and polyamines 1-8, copper iodide, cesium carbonate, 2(isobutyryl)cyclohexanone, $L$-proline and aryl iodides were used without special purification. Dimethylformamide and propionitrile were distilled over $\mathrm{CaH}_{2}$, dichloromethane, petroleum ether and methanol were used freshly distilled.

## General method for $\mathbf{C u}(\mathrm{I})$-catalyzed $N, N^{\prime}$-diarylation of di- and polyamines

A Schlenk tube equipped with a magnetic stirrer and reflux condenser, flushed with dry argon, was charged with CuI (10-20 mol \%), ligand (L-proline (L1) or 2-(isobutyryl)cyclohexanone (L2), $20-40 \mathrm{~mol} \%$ ), aryl iodide ( 2.5 mmol ), appropriate solvent (DMF or EtCN, 2 mL ), and the di- or polyamine ( 1 mmol ). The reaction mixture was stirred for 1 min , then cesium carbonate ( $2.5 \mathrm{mmol}, 845 \mathrm{mg}$ ) was added and the reaction was stirred either under reflux (in the case of EtCN ) or at $110{ }^{\circ} \mathrm{C}$ (in the case of DMF). After ca 24 h upon completion of the reaction the mixture was cooled down to ambient temperature, dichloromethane ( 5 mL ) was added, the organic solution was filtered, the residue was washed additionally with dichloromethane ( $2 \times 5$ mL ), the combined organic fractions were evaporated in vacuo. To obtain individual compounds, the residue was chromatographed on silica gel using a sequence of eluents: $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}(10: 1,3: 1), \mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} / \mathrm{NH}_{3}(\mathrm{aq})$ (100:20:1, 100:20:2, 100:20:3, 100:25:5, 10:4:1) or hexanes/ $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5: 1,3: 1,2: 1,1: 1,1: 2), \mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}$ (100:1).
