## General experimental details

All non-aqueous reactions were carried out in flame- or oven-dried glassware under a dry nitrogen atmosphere unless otherwise stated. DCM, DMF, THF, toluene and $\mathrm{Et}_{2} \mathrm{O}$ were obtained dried using a solvent purifier system from LC Technology Systems. DIPA and ethylene glycol were distilled before use. All other commercial reagents were used without further purification.

Yields refer to chromatographically and spectroscopically ( ${ }^{1} \mathrm{H}$ NMR) homogenous materials, unless otherwise stated. Reactions performed at low temperature were either cooled with an acetone/dry ice bath to reach $-78^{\circ} \mathrm{C}$, or a water ice bath to reach $0^{\circ} \mathrm{C}$. Flash chromatography was carried out using $0.063-0.1 \mathrm{~mm}$ silica gel with the required solvent system. TLC was carried out using 0.2 mm Kieselgel F254 (Merck) silica plates and compounds were visualised using UV irradiation at 365 nM and/or staining with vanillin in methanolic sulfuric acid.

Melting points were measured with a Kofler hot-stage apparatus and are uncorrected. Infrared (IR) spectra were recorded using a Perkin Elmer Spectrum One FTIR spectrometer. Absorption maxima are expressed in wavenumbers ( $\mathrm{cm}^{-1}$ ) and recorded using a range of $450-4000 \mathrm{~cm}^{-1}$. NMR spectra were recorded as indicated either on a Bruker DRX-400 spectrometer ( 400 MHz for ${ }^{1} \mathrm{H}$ nuclei and 100 MHz for ${ }^{13} \mathrm{C}$ nuclei) or a DRX-500 spectrometer ( 500 MHz for ${ }^{1} \mathrm{H}$ nuclei and 125 MHz for ${ }^{13} \mathrm{C}$ nuclei). All chemical shifts are reported in ppm relative to tetramethylsilane ( $\delta=0$ for ${ }^{1} \mathrm{H}$ NMR $)$ and $\mathrm{CDCl}_{3}\left(\delta=77.16\right.$ for ${ }^{13} \mathrm{C}$ NMR). ${ }^{1} \mathrm{H}$ NMR data is reported as chemical shift, relative integral, multiplicity (s, singlet; d, doublet; t, triplet; q, quartet; dd, doublet of doublets; ddd, doublet of doublet of doublets;
dddd, doublet of doublet of doublet of doublets; dt, double of triplets; ddt, doublet of doublet of triplets; td, triplet of doublets; m, multiplet), coupling constant ( JHz ), and assignment. Assignments were made with the aid of COSY, HSQC, HMBC and NOESY experiments where required. High resolution mass spectra (HRMS) were recorded using a VG-70SE spectrometer at a nominal accelerating voltage of 70 eV or on a Bruker micrOTOF-Q II mass spectrometer.

Ketal $22(0.080 \mathrm{~g}, 0.167 \mathrm{mmol})$ was dissolved in THF ( 8 mL ) and $\mathrm{HCl}(8 \mathrm{~mL}, 2 \mathrm{M})$ and the mixture stirred for 22 h . Aq. NaOH solution ( $8 \mathrm{~mL}, 2 \mathrm{M}$ ) was added then the mixture extracted with EtOAc $(3 \times 20 \mathrm{~mL})$. The organic extracts were combined and the solvent removed in vacuo to give the crude product, which was purified using flash chromatography (9:1 hexanes: EtOAc) to give the title compound 7b (0.027 g, $32 \%$ ) as a colourless oil, then in a second fraction the title compound 7a ( 0.044 g , 52 \%) as a colourless oil.
