Complete experimental procedures, characterization and figures of ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra

## Experimental part

## General

All commercially available chemicals were used without further purification. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right)$ and ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ spectra were recorded in $\mathrm{CDCl}_{3}$ solutions on a Varian Mercury 400 spectrometer at $400\left({ }^{1} \mathrm{H}\right)$ and 100 $\mathrm{MHz}\left({ }^{13} \mathrm{C}\right)$, respectively. Chemical shifts $(\delta)$ are reported in ppm relative to TMS ( ${ }^{1} \mathrm{H}$ NMR) and to residual $\mathrm{CDCl}_{3}$ signal ( ${ }^{13} \mathrm{C}$ NMR). High resolution ESI mass spectra were obtained from a Bruker Apex III Fourier transform ion cyclotron resonance (FT-ICR) mass spectrometer equipped with an Infinity ${ }^{\text {TM }}$ cell, a 7.0 Tesla superconducting magnet, an RF-only hexapole ion guide and an external electrospray ion source (Agilent, off axis spray). ESI-MS was recorded on a Finnigan TSQ 7000, LC-Tech Ultra Plus pumps, Linear UV-vis 200 detector, Sepserve Ultrasep ES RP-18 $5 \mu \mathrm{~m} 1 \times 100 \mathrm{~mm}$ column, flow $70 \mu \mathrm{~L} \mathrm{~min}^{-1}$. Flash column chromatography was carried out using Merck silica gel 60 (0.040-0.063 mm ) and analytical thin-layer chromatography (TLC) was performed using Merck silica gel 60 F254 aluminium sheets. HPLC experiments were performed in an Agilent 1100 series equipped with a column SNr. 176: YMC pack $150 \times$ 4.6 LD $102 \AA 5 \mu \mathrm{~m}$ ODS-A and UV detector (200-600 nm). The employed gradient was $\mathrm{MeOH} 0.1 \%$ formic acid: $\mathrm{H}_{2} \mathrm{O} 0.1 \%$ formic acid $1 \mathrm{~mL} / \min (5 \mu \mathrm{~L})$, $\mathrm{MeOH} 2 \%>20 \mathrm{~min}>100 \%(5 \mathrm{~min})$ at $25^{\circ} \mathrm{C}$.

## General procedure for the synthesis of compounds 7a-j

To a stirred solution of aldehyde ( 2.5 mmol ) in methanol ( 2.5 mL ) propargylamine ( $0.14 \mathrm{~g}, 0.16 \mathrm{~mL}, 2.5 \mathrm{mmol}$ ) was added. After 30 min carboxylic acid ( 2.5 mmol ) and isocyanide ( 2.5 mmol ) were added. The contents were stirred for 24 h . The solvent was concentrated under reduced pressure in a rotavap. The crude material was purified by isocratic column chromatography to afford the pure product. The same solvent system used for $R_{\mathrm{f}}$ value measurements was applied for performing flash column chromatography.

## Combinatorial approach to dimers

In a 10 mL round botton flask, to stirred solution of the alkynes $\mathbf{7 f}, \mathbf{7 j}$ and $\mathbf{7 h}$ ( 0.25 mmol each), CuCl ( $0.07 \mathrm{mmol} / 5 \mathrm{~mol} \%$ ) was added. The contents were stirred at $90{ }^{\circ} \mathrm{C}$ under air atmosphere. After 24 h the reaction mixture was diluted with ethyl acetate ( 10 mL ) and filtered through a Celite plug. The solvent was removed under reduced pressure. The crude material analyzed by HPLC.

## Biological activity assay

The antibacterial activity against Bacillus subtilis was determined with a fluorescence based antibacterial growth inhibition assay. The fluorescence was measured on a microtiter plate reader GENios Pro (Fa. Tecan, excitation, 510 nm; emission, 535 nm ). The Bacillus subtilis strain 168 ( $\mathrm{P}_{\text {AbrB }}$-IYFP) was maintained on TY (tryptone-yeast extract) medium supplemented with $1 \%$ Bacto-tryptone, 0.5 \% Bacto-yeast extract, $1 \% \mathrm{NaCl}$ and chloramphenicol (5 $\mu \mathrm{g}$ $\left.\mathrm{ml}^{-1}\right)$. Details of the assay are published:

## Figures of ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra

Please note that spectra of $N$-alkyl-amides (peptoids) like Ugi products display double signal sets in NMR due to interconvertible isomers with s-cis and s-trans amide bonds. Depending on substitution pattern, solvent and temperature, the equilibrium between these forms is shifted and may lead to broadened or doubled peaks of varied intensity.
