Additional experimental data

1. GENERAL INFORMATION

All starting materials were ACS grade and were employed without further purification. Arenediazonium tosylates **2** were prepared by a previously described method [1]. HPLC analysis was conducted with an Agilent 1200 instrument fitted with an Eclipse Plus C18 column (5 μm , 4.6 \times 150 mm) and UV detector. GC–MS (EI) measurements were obtained with an Agilent 7890/5975C instrument. ^1H , ^{13}C NMR and IR spectra were recorded on a Bruker Avance 300 and Perkin Elmer BXII instruments, respectively. Melting points were obtained with a melting point system MP50, Mettler Toledo (values are given uncorrected). HPLC–MS measurements were obtained with a Thermo Scientific DFS High Resolution GC–MS. Microwave heating was carried out with a CEM Discover System (model 908010) at 2455 MHz from MATTHEWS, NC (USA).

2. EXPERIMENTAL PROCEDURE

To the solution of ADT (1 mmol) in H_2O (10 mL) at room temperature were added alkene (1.2 mmol) and $\text{Pd}(\text{OAc})_2$ (0.010 mmol; 2.3 mg). The reaction mixture was heated and held at 75 °C with stirring using a microwave reactor in open-vessel mode with power 50 W. Conversion of ADT was monitored every minute until a negative diazonium test with 2-naphthol. When the diazonium test was negative, the reaction mixture was cooled and in the case of solid methyl cinnamates **3aa**–**3ac** and **3ae**–**3ah** the product was filtered, washed with water (25 mL), and dried on air. Otherwise the reaction mixture was extracted twice with dichloromethane (10 mL), the organic layer was filtered through a pad of silica and dried over anhydrous Na_2SO_4 . The solvent was removed in a rotary evaporator under reduced pressure and the crude product was purified by flash chromatography.
