## Experimental procedures and characterization data of all compounds and copies of ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of selected molecules

## 1. General <br> Working techniques and reagents

Synthetic procedures involving manipulation under inert atmosphere were performed in dried glassware under positive argon pressure using standard Schlenk techniques. Moisture and airsensitive compounds were handled in a glove box (MBraun Labmaster 130).

Commercially available reagents were purchased from Acros, Aldrich, Fluorochem, Strem and used without further purification. Triethylamine was distilled from calcium hydride, 2,6lutidine was distilled under reduced pressure prior to use.

Anhydrous solvents were obtained by distillation from sodium/benzophenone (diethylether, pentane, tetrahydrofuran, toluene) or purification over activated alumina columns under
nitrogen (PureSolv, Innovative Technology Inc.) or obtained from Aldrich or Fluka in septum-sealed bottles under inert atmosphere and over molecular sieves. Oxygen-free solvents were prepared by freeze-pump-thaw degassing.

Column chromatography was performed on silica gel $60(0.040-0.063 \mathrm{~mm})$ or neutral alumina obtained from Aldrich or Merck. Reagents were of technical grade and were distilled prior to use.

## Analytical methods

NMR Spectroscopy: NMR spectra were recorded either on a Bruker Avance $400(400 \mathrm{MHz}$, BBO probe head) or a Bruker Avance DRX 500 ( 500 MHz , BBO or BBI probe heads) NMR spectrometer. Chemical shifts $\delta$ are given in ppm and they are referenced for $\mathrm{CDCl}_{3}$ to $7.26 \mathrm{ppm}\left({ }^{1} \mathrm{H}\right.$ NMR $)$ and $77,16 \mathrm{ppm}\left({ }^{13} \mathrm{C}\right.$ NMR) for $\mathrm{C}_{6} \mathrm{D}_{6}$ to $7.16 \mathrm{ppm}\left({ }^{1} \mathrm{H}\right.$ NMR) and $128.1 \mathrm{ppm}\left({ }^{13} \mathrm{C}\right.$ NMR) and for THF- $d_{8}$ to $3.58 \mathrm{ppm}\left({ }^{1} \mathrm{H}\right.$ NMR) or to internal standard TMS $0 \mathrm{ppm} .{ }^{31} \mathrm{P}$ NMR spectra were calibrated to an external standard of phosphoric acid (85\%) to $0 \mathrm{ppm} .{ }^{19} \mathrm{~F}$ NMR spectra were calibrated to the chemical shift of the most downfield isotopomer of external $\mathrm{CFCl}_{3}$ to $0 \mathrm{ppm} .{ }^{11} \mathrm{~B}$ NMR spectra were calibrated to 0 ppm with $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ as an external standard. The assignment of ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR signals was accomplished with help of DEPT135 NMR experiments or by using 2D NMR experiments (COSY, HMQC, HSQC, HMBC). Multiplets were assigned as s (singlet), d (doublet), dd (doublet of doublet), t (triplet), q (quartet), m (multiplet) and br s (broad singlet).

Mass spectrometry: EI (Electron Impact) and FAB (Fast atom bombardment) mass spectra were recorded by Dr. Heinz Nadig (Department of Chemistry, University of Basel). Electron Impact ionization spectra were recorded on a VG70-250 spectrometer and Fast Atom Bombardment spectra were recorded on a Finnigan MAR312 system with 3-nitrobenzyl alcohol (NBA) as matrix. Electron spray ionization (ESI) was measured on a Varian 1200L

Triple Quad MS/MS spectrometer with the sample concentrations between $10^{-4}$ and $10^{-5} \mathrm{M}$ ( 40 psi nebulizing gas, 4.9 kV spray voltage, 18 psi drying gas at $200^{\circ} \mathrm{C}, 38-75 \mathrm{~V}$ capillary voltage, $1300-1500 \mathrm{~V}$ detector voltage). MALDI (Matrix-assisted laser desorption ionization) spectra were recorded on a Voyager-DE-Pro or Bruker Microflex system with p-nitroaniline or 2,5-dihydroxybenzoic acid as matrices. The signals are given in mass-to-charge ratios ( $\mathrm{m} / \mathrm{z}$ ) with the relative intensities in brackets.

Elemental analysis: Elemental analyses were measured by Mr. W. Kirsch (Department of Chemistry, University of Basel) on a Lenco CHN-900 system.

Melting points: Melting points were determined on a Büchi 535 melting point apparatus and are uncorrected.

Optical rotations: Optical rotations were measured on a Perkin Elmer Polarimeter 341 ( $l$ = 1 dm ) at $20^{\circ} \mathrm{C}$ at 589 nm (sodium lamp). The concentration $c$ is given in $\mathrm{g} / 100 \mathrm{~mL}$.

Infrared spectroscopy: Infrared spectra were recorded on a Perkin Elmer 1600 series FTIR spectrometer or on a Shimadzu FTIR-8400S spectrometer (Golden Gate ATR). Liquid samples were measured as a thin layer between two sodium chloride plates and solid samples were compressed into potassium bromide pellets. The absorption bands are given in wavenumbers $\left(\tilde{v}\left[\mathrm{~cm}^{-1}\right]\right)$. The peak intensity is given as s (strong), m (medium), w (weak). The index br stands for broad.

Gas chromatography: Gas chromatograms were recorded on Carlo Elba HRGC Mega2 Series 800 (HRGS Mega 2) instruments. Separations on an achiral stationary phase were performed on a Restek Rtx-1710 column ( $30 \mathrm{~m} \times 0.25 \mathrm{~mm} \times 0.25 \mu \mathrm{~m}$ ); for separations on a chiral stationary phase $\beta$ - and $\gamma$-cyclodextrin columns ( $30 \mathrm{~m} \times 0.25 \mathrm{~mm} \times 0.25 \mu \mathrm{~m}$ ) were used.

Gas chromatography with mass spectrometric detection (GC-MS): A HP6890 gas chromatograph with HP5970A mass detector (EI) was used. Column: Macherey-Nagel OPTIMA1 Me2Si $(25 \mathrm{~m} \times 0.2 \mathrm{~mm} \times 0.35 \mu \mathrm{~m}, 20 \mathrm{psi}$, split ca. $20: 1$, carrier gas: $1 \mathrm{~mL} / \mathrm{min}$ helium). Shimadzu GC-MS-QP2010 SE; column: Rtx-5MS ( $30 \mathrm{~m} \times 0.25 \mathrm{~mm} \times 0.25 \mu \mathrm{~m}$, 100 kPa , split ca. 40:1, carrier gas: $3 \mathrm{~mL} / \mathrm{min}$ ).

High-performance liquid chromatography (HPLC): A Shimadzu system with SCL-10A system controller, CTO-10AC column oven, LC10AD pump system, and DGU-14a degasser was used. Columns: Chiracel OD-H, OJ-H, AD-H ( $4.6 \times 250 \mathrm{~mm}$; Daicel Chemical Industries).

## 2. Synthetic procedures and analytical data

8: (S)-3-Chloro- $N$-(1-hydroxy-3-methyl-1,1-diphenylbutan-2-yl)-2,2-dimethylpropanamide

The aminoalcohol $7\left(1.03 \mathrm{~g}, 4.03 \mathrm{mmol}, 1.00\right.$ equiv) was dissolved in 10 mL of dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, $\mathrm{NEt}_{3}$ ( $0.61 \mathrm{~mL}, 4.43 \mathrm{mmol}, 1.10$ equiv) was added under stirring and the mixture was cooled to $0{ }^{\circ} \mathrm{C}$. Then, 3-chloropivaloyl chloride ( $625 \mathrm{mg}, 4.03 \mathrm{mmol}, 1.00$ equiv) dissolved in 10 mL of dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added drop wise under stirring and the cooling bath was removed. The mixture was stirred over night at rt and the reaction quenched by the addition of 10 mL of a 1 m HCl solution. The phases were separated and the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ $(2 \times 10 \mathrm{~mL})$. The combined organic phases were washed with saturated $\mathrm{NaHCO}_{3}$ solution $(10 \mathrm{~mL})$. The aqueous phase was back-extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 10 \mathrm{~mL})$. The combined organic phases were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed leaving a yellow solid. To the crude product were added 10 mL of ethyl acetate and 40 mL of
hexanes. The suspension was heated to reflux and additional ethyl acetate ( 12 mL ) was added until all solids dissolved. The hot solution was filtered and the filter was rinsed with 20 mL of hot hexanes. The solution was cooled in a freezer $\left(-20^{\circ} \mathrm{C}\right)$ over night. A first batch of product was collected as colorless crystals ( $830 \mathrm{mg}, 2.22 \mathrm{mmol}, 50 \%$, mp: $182-183{ }^{\circ} \mathrm{C}$ ). The mother liquor was concentrated and 10 mL of hexanes added to the solid. The obtained mixture was heated to reflux. When the mixture was cooled to rt again the mother liquor was decanted and the process repeated by addition of 5 mL of hexanes. The remaining white solid ( 418 mg , $1.12 \mathrm{mmol}, 28 \%$ ) was pure based on ${ }^{1} \mathrm{H}$ NMR analysis and had a mp of $164-165^{\circ} \mathrm{C}$. The combined yield was 1.25 g ( $3.34 \mathrm{mmol}, 83 \%$ ).

9: (S)-2-(1-Chloro-2-methylpropan-2-yl)-4-isopropyl-5,5-diphenyl-4,5-dihydrooxazole

Amide 8 ( $650 \mathrm{mg}, 1.74 \mathrm{mmol}$ ) was dissolved in 10 mL of $\mathrm{CHCl}_{3}$. Methanesulfonic acid was added drop wise $(0.3 \mathrm{~mL})$ and the mixture heated to reflux. A solid extractor containing 4 g of activated molecular sieves ( $4 \AA$ ) was used to remove water. After 3 h of reflux, the mixture was cooled to $0{ }^{\circ} \mathrm{C}$ and 10 mL of a saturated $\mathrm{NaHCO}_{3}$ solution were added. The aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 10 \mathrm{~mL})$, the combined organic phases were washed with brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed and the crude product was dried under high vacuum to give 615 mg of a slightly yellow oil ( $99 \%$ yield, pure by ${ }^{1} \mathrm{H}$ NMR). The oil was dissolved in 5 mL of hexanes, filtered and the filter was rinsed with 10 mL of hexanes. The solvent was removed and the product was dried under high vacuum to give 584 mg ( $1.64 \mathrm{mmol}, 94 \%$ ) of product 9 as yellow oil.

10: (S)-2-(1-(Diphenylphosphino)-2-methylpropan-2-yl)-4-isopropyl-5,5-diphenyl-4,5dihydrooxazole

A dry J.-Young tube was charged with oxazoline 9 ( $200 \mathrm{mg}, 562 \mu \mathrm{~mol}, 1.00$ equiv) and sealed under argon $(3 \times)$. A 0.5 m solution of $\mathrm{KPPh}_{2}$ in THF ( $1.4 \mathrm{~mL}, 0.70 \mathrm{mmol}, 1.25$ equiv) was added and the mixture was stirred at $80^{\circ} \mathrm{C}$ for 6 h . The solution was cooled to $0^{\circ} \mathrm{C}$ and a few drops of water were added until the solution became colorless. Then 10 mL of a saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution were added followed by 20 mL of MTBE. The phases were separated and the aqueous phase was extracted with $2 \times 10 \mathrm{~mL}$ of MTBE. The combined organic phases were washed with brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Silica gel was added and the solvent was removed on a rotavap. The compound was purified by filtration through silica gel ( $\mathrm{h} \times \mathrm{d}, 11 \mathrm{~cm} \times 3 \mathrm{~cm}$, pentane/ethyl acetate, 20/1). The product was obtained as a colorless wax ( 154 mg , $0.31 \mathrm{mmol}, 54 \%)$.

15: (S)-Methyl 2-(3-chloro-2,2-dimethylpropanamido)-3-methylbutanoate

L-Valine methyl ester hydrochloride ( $8.38 \mathrm{~g}, 50.0 \mathrm{mmol}, 1.00$ equiv) was suspended in 75 mL of dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ in a three-necked sulfonation flask with mechanical stir bar. The solution was cooled to $0{ }^{\circ} \mathrm{C}$ and 20.9 mL of $\mathrm{NEt}_{3}$ ( $150 \mathrm{mmol}, 3.00$ equiv) were added under stirring. To this mixture a solution of 7.75 g of 3 -chloropivaloylchloride ( $50.0 \mathrm{mmol}, 1.00$ equiv) in 25 mL of dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added over 30 min , keeping the temperature between 0 and $10^{\circ} \mathrm{C}$. When the addition was completed, the cooling bath was removed and the reaction mixture was stirred until rt was reached. The mixture was heated to reflux for 1.5 h (brown color), cooled to rt and extracted with 50 mL of water, followed by 50 mL of a 1 m solution of HCl . The combined aqueous phases were extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 50 \mathrm{~mL})$ and the combined organic phases were washed with 50 mL of a saturated $\mathrm{NaHCO}_{3}$ solution. The aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(25 \mathrm{~mL})$ and the combined organic phases were washed with 50 mL of brine. The organic phase was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed on a rotovap and the crude product was dried using an oil pump until constant pressure was obtained ( $10^{-1} \mathrm{mbar}$ ). The crude product was obtained as a brown oil ( 12.44 g ) which was taken up in 20 mL of hexanes. Active carbon ( 300 mg ) was added, the mixture was refluxed for 5 min and filtered hot. The filter was rinsed with hot hexanes ( $5 \times 20 \mathrm{~mL}$ ) and the solution was put in a freezer $\left(-20^{\circ} \mathrm{C}\right)$ over night. The mother liquor was decanted. The product was obtained as a colorless solid containing some brown material as impurity. This mixture was allowed to warm to rt causing the colorless solid to melt, while the impurity remained solid. The liquid was decanted and the flask and the impurity were rinsed with hexane $(3 \times 2 \mathrm{~mL})$ and combined with the product. The solvent was removed and the residue dried at $10^{-1} \mathrm{mbar}$. The product, a slightly yellow liquid, was cooled in a dry-ice/acetone bath and put again under
vacuum to initiate crystallization. Finally, $10.1 \mathrm{~g}(40.4 \mathrm{mmol}, 81 \%)$ of an off-white solid were obtained. The impurity and the mother liquor were combined and the mixture was cooled in a dry-ice/acetone bath under shaking. The impurity crystallized first and the cold solution was filtered to remove the impurity. The filter was washed with 4 mL of cold hexanes and the solution was cooled to $-78{ }^{\circ} \mathrm{C}$. The mother liquor was decanted and the crystalline product was dried under vacuum to give 1.47 g ( $5.88 \mathrm{mmol}, 12 \%$ ) as a second batch. Total yield: 11.6 g ( $46.3 \mathrm{mmol}, 93 \%$ ).

16: (S)-1-(1-Hydroxy-3-methyl-1,1-diphenylbutan-2-yl)-3,3-dimethylazetidin-2-one

To a dry sulfination flask equipped with a mechanical stir bar, a reflux condenser, a dropping funnel and a neck closed with a stopper were added 5.00 g ( $20.0 \mathrm{mmol}, 1.00$ equiv) of ester 15. Vacuum was applied and the flask was backfilled with argon. Dry THF ( 40 mL ) was added under stirring and the solution was cooled to $0^{\circ} \mathrm{C}$. Through the dropping funnel a 1 m solution of PhMgBr in dry THF ( $66 \mathrm{~mL}, 66.0 \mathrm{mmol}, 3.30$ equiv) was added over 30 min . The temperature was kept in a range between -5 and $0{ }^{\circ} \mathrm{C}$. After complete addition, the cooling bath was removed and the solution stirred for additional 30 min . Then the solution was heated to reflux for 2 h . After 2 h approximately 50 mL of THF were distilled off and the solution was cooled to $0{ }^{\circ} \mathrm{C}$. A saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 10 mL ) was added drop wise followed by 50 mL of MTBE. The mixture was stirred for 10 min and 40 mL of a 1 M HCl solution were added. The phases were separated and the aqueous phase was washed with 50 mL of MTBE, then again with 25 mL of MTBE. The combined organic phases were washed with 50 mL of saturated $\mathrm{NaHCO}_{3}$ solution and the aqueous phase was extracted with 25 mL of ethyl acetate. The combined organic phases were washed with 50 mL of brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed on a rotovap. During this process the product started to crystallize. Approximately 100 mL of hexanes were added to the residue and the mixture was heated to reflux. Ethyl acetate was added portion wise to the refluxing mixture until most of the compound had dissolved (approx. 40 mL ). The solution was filtered hot and placed in a refrigerator $\left(+5^{\circ} \mathrm{C}\right)$ over night. The mother liquor was decanted and the colorless crystals were rinsed with 6 mL of hexane. A fraction ( $2.98 \mathrm{~g}, 7.97 \mathrm{mmol}, 40 \%$ ) was collected having a mp of $183-184{ }^{\circ} \mathrm{C}$.

12: (4S,5S)-Methyl 2-(1-chloro-2-methylpropan-2-yl)-5-methyl-4,5-dihydrooxazole-4carboxylate

Amide 11 ( $1.12 \mathrm{~g} ; 4.45 \mathrm{mmol}, 1.00$ equiv) and Burgess reagent ( $1.38 \mathrm{~g}, 5.79 \mathrm{mmol}$, 1.30 equiv) were dissolved in 40 mL THF and the mixture refluxed for 4 h . Afterwards THF was removed under reduced pressure, the obtained residue treated with $\mathrm{Et}_{2} \mathrm{O}$ and remaining solids were filtered off. The remaining yellowish oil ( 1.20 g ) was distilled in a Kugelrohr
oven $\left(110^{\circ} \mathrm{C} / 0.08\right.$ Torr) to give $924 \mathrm{mg}(3.96 \mathrm{mmol}, 89 \%$ yield $)$ of the product as colorless oil, which was used in the next step without further purification. When using DAST for the oxazoline-ring closure the product yield was $93 \%$. An analytically pure sample was obtained by column chromatography with $\mathrm{EtOAc} / \mathrm{Hex}\left(1: 5, R_{\mathrm{f}} 0.25\right)$.

13: 2-((4S,5S)-2-(1-Chloro-2-methylpropan-2-yl)-5-methyl-4,5-dihydrooxazol-4-yl)propan-2ol

Oxazoline $12(2.00 \mathrm{~g}, 8.58 \mathrm{mmol}, 1.00$ equiv) was dissolved in 30 mL dry THF and 5.7 mL MeMgCl ( 3 M in THF, 2.00 equiv) were added drop wise at $-78{ }^{\circ} \mathrm{C}$. The reaction mixture was allowed to warm up slowly in the dry ice cooling bath overnight. After quenching with $\mathrm{NH}_{4} \mathrm{Cl}$ the mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}$. The organic phases were dried over $\mathrm{MgSO}_{4}$ and
concentrated to give 1.88 g of crude product. Kugelrohr distillation ( $100^{\circ} \mathrm{C} / 0.2 \mathrm{Torr}$ ) afforded $1.60 \mathrm{~g}(6.86 \mathrm{mmol}, 80 \%)$ of the product 13.
${ }^{1} \mathbf{H}-\mathbf{N M R}\left(500.1 \mathrm{MHz}, \mathrm{CDCl}_{3}, 300 \mathrm{~K}\right): \delta(\mathrm{ppm}) 4.75(\mathrm{~m}, 1 \mathrm{H}, \mathrm{OCH}), 3.89(\mathrm{~d}, 1 \mathrm{H}, J=9.0 \mathrm{~Hz}$, $\mathrm{NCH}), 3.63(\mathrm{~d}, 2 \mathrm{H}, J=2.5 \mathrm{~Hz} \mathrm{CH} 2 \mathrm{Cl}), 1.46\left(\mathrm{~d}, 3 \mathrm{H}, J=7.0 \mathrm{~Hz}, \mathrm{CH}\left(\mathrm{CH}_{3}\right), 1.34\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)\right.$, $1.31\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.30\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.27\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$ ) ${ }^{\mathbf{1 3}} \mathbf{C}\left\{{ }^{\mathbf{1}} \mathbf{H}\right\}-\mathbf{N M R}\left(125.8 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$, $300 \mathrm{~K}): \delta(\mathrm{ppm}) 171.0(C($ quart.) ), $79.4(\mathrm{OCH}), 71.8(\mathrm{NCH}), 71.8(\mathrm{COH}($ quart.)), 52.6

14: 2-((4S,5S)-2-(1-(Diphenylphosphino)-2-methylpropan-2-yl)-5-methyl-4,5-dihydrooxazol-4-yl)propan-2-ol

Neopentyl chloride $\mathbf{1 3}$ ( $107 \mathrm{mg}, 0.46 \mathrm{mmol}, 1.00$ equiv) was dissolved in 5 mL dry THF and $0.29 \mathrm{~mL} n-\operatorname{BuLi}\left(1.6 \mathrm{M}\right.$ in $n$-hexanes, $0.46 \mathrm{mmol}, 1.00$ equiv) was added at $0^{\circ} \mathrm{C}$, followed by 0.92 mL of $\mathrm{KPPh}_{2}$ ( 0.5 M in THF, $0.46 \mathrm{mmol}, 1.00$ equiv). Then the reaction mixture was warmed to rt and subsequently refluxed for 15 h . The solvent was evaporated and the residue dissolved in 20 mL MTBE. The solution was washed with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}(6 \mathrm{~mL})$ and the aqueous layer extracted with MTBE $(3 \times 10 \mathrm{~mL})$. The combined organic phases were
washed with brine and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Chromatography on silica gel with $\mathrm{EtOAc} / \mathrm{Hex}$ (1:2) afforded 120 mg ( $0.31 \mathrm{mmol}, 68 \%$ yield) of the product as a transparent oil which solidified in the refrigerator at $+5^{\circ} \mathrm{C}$ within a few days.

## Ir-14-OH

Ligand 14 ( $30.0 \mathrm{mg}, 78.0 \mu \mathrm{~mol}, 1.00$ equiv) and bis(1,5-cyclooctadiene)diiridium(I) dichloride ( 26.0 mg , $39.0 \mu \mathrm{~mol}$, 0.50 equiv) were dissolved in 3 mL dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and refluxed for 2.5 h under argon. Then of $\mathrm{NaBAr}_{\mathrm{F}}(90.0 \mathrm{mg}, 101 \mathrm{mmol}, 1.30$ equiv) were added and the mixture stirred for 30 min at rt . Silica gel ( 2 g ) was added and the solvent removed on a rotavap. The immobilized complex was transferred to a silica gel column $(2 \times 12 \mathrm{~cm})$. The column was flushed with 100 mL of $\mathrm{Et}_{2} \mathrm{O}$ followed by 100 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The orange product, eluted by $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, was collected in one fraction. The resulting orange solution was concentrated under vacuum and the resulting solid dissolved in $\mathrm{CHCl}_{3}$ and concentrated again to remove residual water. The addition/evaporation of $\mathrm{CHCl}_{3}$ was repeated three times. After
drying the residue under high vacuum, 119 mg ( $78.0 \mu \mathrm{~mol}, 99 \%$ yield) of complex $\mathbf{I r} \mathbf{- 1 4 - \mathbf { O H }}$ was obtained as an orange solid.

## Serine-derived NeoPHOX ligands

17: (S)-Methyl 2-(3-chloro-2,2-dimethylpropanamido)-3-hydroxypropanoate

To a solution of L-serine methylester hydrochloride ( $1.00 \mathrm{~g} ; 6.43 \mathrm{mmol}, 1.00$ equiv) in 10 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 2.7 \mathrm{~mL}\left(19.3 \mathrm{mmol}, 3.00\right.$ equiv) of $\mathrm{NEt}_{3}$ were added at $0{ }^{\circ} \mathrm{C}$. After stirring for 30 min at $0^{\circ} \mathrm{C}, 0.83 \mathrm{~mL}$ ( $6.43 \mathrm{mmol}, 1.00$ equiv) of 3-chloropivaloyl chloride was added drop wise and the mixture was stirred for 1 h at rt . The reaction mixture was poured into a saturated solution of $\mathrm{NaHCO}_{3}$ and the aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic phases were dried over $\mathrm{MgSO}_{4}$ and concentrated. Column chromatography on silica gel using EtOAc as eluent $\left(R_{\mathrm{f}} 0.4\right)$ gave $1.21 \mathrm{~g}(5.08 \mathrm{mmol}, 79 \%$ yield $)$ of product 17 as a colorless oil.
${ }^{1} \mathbf{H}-$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta=6.85(\mathrm{~d}, J=7.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{NH}), 4.64-4.57(\mathrm{~m}, 1 \mathrm{H}, \mathrm{NCH})$, 3.92 (ddd, $\left.J=43.8 \mathrm{~Hz}, J=11.3 \mathrm{~Hz}, J=3.5 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{O}\right), 3.80\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CO}_{2} \mathrm{Me}\right), 3.61(\mathrm{dd}$, $\left.J=38.7 \mathrm{~Hz}, J=10.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Cl}\right), 1.32\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.30\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) .{ }^{\mathbf{1 3}} \mathbf{C}\left\{{ }^{\mathbf{1}} \mathbf{H}\right\}$-NMR

## General procedure for allylic substitution

A solution of 1.8 mg of $[\mathrm{Pd}(\text { allyl }) \mathrm{Cl}]_{2}(0.01 \mathrm{mmol})$ and 0.025 mmol of the appropriate ligand in 1.2 mL of dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was degassed in a Young tube by three freeze-pump-thaw cycles and then stirred for 2 h at $50^{\circ} \mathrm{C}$. In a second Young tube, 1.00 mmol of the substrate was
dissolved in 4 mL of dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and 396 mg of dimethyl malonate ( 3.00 mmol ), BSA ( $0.73 \mathrm{~mL} ; 610 \mathrm{mg} ; 3.00 \mathrm{mmol}$ ) and 1 mg of dried KOAc were added. The mixture was degassed by three freeze-pump-thaw cycles and then the catalyst solution was added. The resulting reaction mixture was stirred at rt for 24 h under argon. For workup the reaction mixture was diluted with $\mathrm{Et}_{2} \mathrm{O}$ and quenched by addition of 20 mL of sat. aq. $\mathrm{NH}_{4} \mathrm{Cl}$ solution. The aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 15 \mathrm{~mL})$ and the combined organic extracts were dried over $\mathrm{MgSO}_{4}$. After removal of the solvent and column chromatography on silica gel (hexanes/EtOAc/Et ${ }_{3} \mathrm{~N}$ 18:1:1) the product was obtained as a white solid.

## Determination of the enantiomeric excess

HPLC (Daicel Chiracel AD-H, heptane/isopropanol 97:3, $0.9 \mathrm{mLimin}^{-1}, 20^{\circ} \mathrm{C}, 254 \mathrm{~nm}$ ); $t_{\mathrm{R}}=16.3(R), 17.9(S) \mathrm{min}$.

GC $\left(\beta\right.$-cyclodextrin $\left.\mathrm{PM}, 130^{\circ} \mathrm{C}, 100 \mathrm{kPa}\right) ; t_{\mathrm{R}}=21.7(R), 23.7(S) \mathrm{min}$.

Integration of the OMe peaks in the ${ }^{1} \mathrm{H}$ NMR spectrum using $\mathrm{Eu}(\mathrm{hfc})_{3}$ as chiral shift reagent.

## Asymmetric hydrogenation

All hydrogenation reactions were performed according to a published procedure [1] at rt under 50 bar of $\mathrm{H}_{2}$ gas with $1 \mathrm{~mol} \%$ of catalyst (substrate concentration $0.2 \mathrm{~mol} / \mathrm{L}$ ) in dichloromethane (Aldrich, crown cap).

## Product analyses

Hydrogenation of $E$-1,2-diphenylpropene:
GC: Restek Rtx-1710 column ( $30 \mathrm{~m} \times 0.25 \mathrm{~mm} \times 0.25 \mu \mathrm{~m}$ ), $60 \mathrm{kPa} \mathrm{He},\left(100{ }^{\circ} \mathrm{C}-2 \mathrm{~min}-\right.$ $\left.7 \mathrm{~K} / \mathrm{min}-250^{\circ} \mathrm{C}-10 \mathrm{~min}\right): t_{\mathrm{R}}=18.2 \mathrm{~min}($ product $), 23.8 \mathrm{~min}($ starting material)

HPLC: (Diacel Chiracel OJ ( $2.6 \times 250 \mathrm{~mm}$ ), heptane/isopropanol 99:1, $0.5 \mathrm{~mL} / \mathrm{min}, 20^{\circ} \mathrm{C}$, $220 \mathrm{~nm}, t_{R}=15.6 \mathrm{~min}(R), 23.8 \mathrm{~min}(S)$

Hydrogenation of ethyl E-2-methylcinnamate:
GC: Chiraldex $\gamma$-cyclodextrin TFA G-TA $(30 \mathrm{~m} \times 0.25 \mathrm{~mm} \times 0.12 \mu \mathrm{~m}) 60 \mathrm{kPa} \mathrm{H}_{2},\left(85{ }^{\circ} \mathrm{C}-\right.$ $\left.50 \mathrm{~min}-10 \mathrm{~K} / \min -160^{\circ} \mathrm{C}\right): t_{\mathrm{R}}=42.9 \mathrm{~min}((R)$-product $), 44.9 \mathrm{~min}((S)$-product $), 57.0 \mathrm{~min}$ (starting material).

Hydrogenation of E-2-methyl-3-phenylprop-2-enol:
GC: Restek Rtx-1710 column ( $30 \mathrm{~m} \times 0.25 \mathrm{~mm} \times 0.25 \mu \mathrm{~m}$ ), $60 \mathrm{kPa} \mathrm{He},\left(100{ }^{\circ} \mathrm{C}-2 \mathrm{~min}-\right.$ $\left.7 \mathrm{~K} / \mathrm{min}-250^{\circ} \mathrm{C}-10 \mathrm{~min}\right): t_{\mathrm{R}}=14.6 \mathrm{~min}($ product $), 16.5 \mathrm{~min}($ starting material).

HPLC: (Diacel Chiracel OD-H ( $2.6 \times 250 \mathrm{~mm}$ ), heptane/isopropanol $95: 5,0.5 \mathrm{~mL} / \mathrm{min}$, $40^{\circ} \mathrm{C}, 200 \mathrm{~nm}, t_{\mathrm{R}}=15.3 \min (+), 17.5 \min (-)$.

Hydrogenation of $E$-phenyl-(1-phenylethylidene)amine:
GC: Restek Macherey-Nagel Optima 5-Amin ( $30 \mathrm{~m} \times 0.25 \mathrm{~mm} \times 0.5 \mu \mathrm{~m}$ ), 60 kPa He , $\left(150{ }^{\circ} \mathrm{C}-7 \mathrm{~K} / \mathrm{min}-250^{\circ} \mathrm{C}-10 \mathrm{~min}\right): t_{\mathrm{R}}=12.8 \mathrm{~min}($ product $), 13.2 \mathrm{~min}($ starting material $)$

HPLC: (Diacel Chiracel OD-H ( $2.6 \times 250 \mathrm{~mm}$ ), heptane/isopropanol 99:1, $0.5 \mathrm{~mL} / \mathrm{min}$, $20^{\circ} \mathrm{C}, 210 \mathrm{~nm}, t_{\mathrm{R}}=24.6 \min (S), 33.0 \mathrm{~min}(R)$.

## Crystallographic data

X-ray crystal structures were measured by Dr. Markus Neuburger (Department of Chemistry, University of Basel) on a Bruker Nonius KappaCCD diffractometer using graphitemonochromated $\mathrm{MoK} \alpha$ radiation and solved using direct methods (Sir97, [2] Superflip [3] or SHELX [4]) and refined in Crystals [5]. Least-squares refinement against F was carried out on all non-hydrogen atoms. Chebychev polynomial weights were used to complete the refinement [6]. The absolute configuration was be determined by definition of the flack parameter [7]. Data were recorded at 123 K . Crystals were usually grown by dissolving the
complex in dichloromethane or chloroform and carefully overlaying the solution with $n$ heptane. The crystals were mounted with paraffin on a glass fiber goniometer head.

Crystallographic data of the complexes ser-PHOX-OMe (CCDC 1473372), Ir-14-TES (CCDC 1473373), Ir-14-TMS (CCDC 1473374), Ir-14-TBDMS (CCDC 1473375), Ir-20TBDMS (CCDC 1473376), and Ir-1b (CCDC 1473377) have been deposited at the Cambridge Crystallographic Data Center. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_req.uest/cif.
