## Procedures, ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data of all compounds

All reactions were run under argon in Schlenk tubes using vacuum lines. DMA analytical grade was not distilled before use. KOAc $(99 \%)$ and $\operatorname{Pd}(\mathrm{OAc})_{2}(98 \%)$ were used. Commercial thiophene derivatives, aryl bromides and heteroarenes were used without purification. The reactions were followed by GC and NMR. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ spectra were recorded with a Bruker 400 MHz spectrometer in $\mathrm{CDCl}_{3}$ solutions. Chemical shifts are reported in ppm relative to $\mathrm{CDCl}_{3}\left(7.25\right.$ for ${ }^{1} \mathrm{H}$ NMR and 77.0 for ${ }^{13} \mathrm{C}$ NMR). Flash chromatography was performed on silica gel (230-400 mesh).

## General procedure for the synthesis of 1-18

In a similar manner as described in [1], as a typical experiment, the 2-bromothiophene derivative ( 2 mmol ), aryl bromide derivative ( 1 mmol ), $\mathrm{KOAc}(0.196 \mathrm{~g}, 2 \mathrm{mmol})$ and $\mathrm{Pd}(\mathrm{OAc})_{2}(2.2 \mathrm{mg}, 0.01 \mathrm{mmol})$ were dissolved in DMA ( 5 mL$)$ under an argon atmosphere. The reaction mixture was stirred at $80{ }^{\circ} \mathrm{C}$ for 2 h . After evaporation of the solvent, the product was purified by silica gel column chromatography.
