### 1.1 General

All reagents used for reactions and preparative chromatography were distilled. Solvents used in reactions were pre-dried in their reagent bottles and then distilled over the appropriate drying medium under a nitrogen atmosphere. Acetonitrile, dichloromethane and methanol were distilled from calcium hydride. Triethylamine was distilled from, and stored over, potassium hydroxide. Acetic anhydride was distilled before storage over $4 \AA$ molecular sieves. $p$-Toluenesulfonyl chloride was purified according to Perrin et al. [1] before use, and stored in a desiccator until required. All reactions were performed under an inert atmosphere (either dry nitrogen or argon) using a standard manifold line connected to a vacuum pump. The $R_{\mathrm{f}}$ values quoted are for thin layer chromatography (TLC) on aluminium-backed MachereyNagel ALUGRAMSil G/UV254 plates pre-coated with 0.25 mm silica gel 60, or Aldrich TLC plates (silica gel on aluminium). Macherey-Nagel Silica gel 60 (particle
size $0.063-0.200 \mathrm{~mm}$ ) was used as the adsorbent for conventional preparative column chromatography, with a silica to product ratio of $30: 1$. The elution process was performed using the indicated solvent mixtures either under gravity or air pump pressure conditions. Whatman Partisil Prep 40 (particle size $0.040-0.063 \mathrm{~mm}$ ) was used for preparative flash chromatography. Concentration or evaporation in vacuo refers to the removal of solvent under reduced pressure ( $\sim 20 \mathrm{~mm} \mathrm{Hg}, 45^{\circ} \mathrm{C}$ ) on a rotary evaporator and final drying on an oil pump ( $\sim 1-2 \mathrm{~mm} \mathrm{Hg}$ ) at room temperature. Intermediates 3,5 and $\mathbf{6}$ were prepared as described previously [2]. All melting points were obtained on a Reichert hot-stage microscope, and are uncorrected. Infrared spectra were obtained on a Bruker Vector 22 spectrometer, or a Varian 800 FTIR spectrometer (Scimitar Series). The absorptions are reported on the wavenumber $\left(\mathrm{cm}^{-1}\right)$ scale, in the range $400-4000 \mathrm{~cm}^{-1}$. Hydrogen ( ${ }^{1} \mathrm{H}$ NMR $)$ and carbon $\left({ }^{13} \mathrm{C}\right.$ NMR) nuclear magnetic resonance spectra were recorded on a Bruker Avance- 300 instrument at 300.13 MHz and 75 MHz , respectively using standard pulse sequences. The probe temperature for all experiments was $300 \pm 1 \mathrm{~K}$. All spectra were recorded in deuterated chloroform $\left(\mathrm{CDCl}_{3}\right)$ in 5 mm NMR tubes. Chemical shifts are reported in parts per million (ppm) relative to tetramethylsilane as internal standard in the case of ${ }^{1} \mathrm{H}$ NMR spectra, and relative to the central signal of deuterated chloroform taken at $\delta 77.16$ for the ${ }^{13} \mathrm{C}$ NMR spectra. High-resolution mass spectra were recorded on a VG7-SEQ Double Focussing Mass Spectrometer at 70 eV and 200 mA . The polarity was positive, ionisation employed was El with a resolution of 3000 , a mass range of $3000 \mathrm{amu}(8 \mathrm{kV})$ and a scan rate of $5 \mathrm{~s} /$ decade.
1.2 General procedure for the sulfide contraction of 3-(2-thioxo-1-pyrrolidinyl)propyl acetate (3)

The thiolactam 3 (1 equiv) [2] and the relevant halide (1.05 equiv) were stirred at rt in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(2 \mathrm{~mL} \mathrm{mmol}^{-1}\right)$ for 5 h . The solvent was removed under high vacuum, and the resulting salt was stirred at rt for 18 h to complete the reaction. The salt was dissolved in $\mathrm{MeCN}\left(3 \mathrm{~mL} \mathrm{mmol}{ }^{-1}\right)$, to which was added a solution of $\mathrm{PPh}_{3}$ (1.05 equiv) and dry $\mathrm{NEt}_{3}$ ( 1.05 equiv) in $\mathrm{MeCN}\left(3 \mathrm{~mL} \mathrm{mmol}^{-1}\right)$. The mixture was then stirred at rt for 5 h , during which time a white precipitate was formed. The solution was filtered through a pad of celite and evaporated in vacuo. The residue was taken up in EtOAc ( $10 \mathrm{~mL} \mathrm{mmol}{ }^{-1}$ ), triturated for 30 min and again filtered through a pad of celite. The filtrate was extracted with $\mathrm{HCl}\left(2 \mathrm{M}, 3 \times 10 \mathrm{~mL} \mathrm{mmol}^{-1}\right)$, the aqueous extracts were brought to pH 11 with aq. $\mathrm{NH}_{3}$ solution (35\%) and back-extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(3 \times 10 \mathrm{~mL} \mathrm{mmol}{ }^{-1}\right)$. The organic extracts were combined, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated in vacuo to yield the crude products 7. The products were purified by column chromatography on silica gel.

General procedure for acetate hydrolysis
To a stirred solution of the required enaminone 7 in $\mathrm{MeOH}\left(3.6 \mathrm{~mL} \mathrm{mmol}^{-1}\right)$ was added $\mathrm{K}_{2} \mathrm{CO}_{3}$ (1.1-2.0 equiv). After 3 h the mixture was filtered through celite. The filtrate was evaporated in vacuo, and then taken up in $\mathrm{CHCl}_{3}\left(10 \mathrm{~mL} \mathrm{mmol}^{-1}\right)$ and washed with satd. aq. NaCl solution $\left(10 \mathrm{~mL} \mathrm{mmol}^{-1}\right)$. The aqueous phases were back extracted with $\mathrm{CHCl}_{3}\left(3 \times 10 \mathrm{~mL} \mathrm{mmol}{ }^{-1}\right)$, dried $\left(\mathrm{MgSO}_{4}\right)$ filtered and evaporated in vacuo to afford the crude product. The crude mixture was purified by column chromatography to yield the desired alcohols 8 .

General procedure for the alkylative ring closure to 1,2,3,5,6,7-hexahydroindolizines A stirring solution of alcohol 8 in a mixture of $\mathrm{MeCN}\left(6.2 \mathrm{~mL} \mathrm{mmol}^{-1}\right)$ and PhMe ( $3.1 \mathrm{~mL} \mathrm{mmol}^{-1}$ ) was charged with $\mathrm{PPh}_{3}$ (2.0-3.0 equiv) and imidazole (2.03.0 equiv). Once the solids had dissolved, $I_{2}$ ( 2.0 equiv) was added in one portion. The homogeneous solution was stirred under reflux for 1 h . The reaction was quenched by the addition of a solution of satd. aq. $\mathrm{NaHCO}_{3}\left(10 \mathrm{~mL} \mathrm{mmol}^{-1}\right)$, and the aqueous residue was extracted with EtOAc $\left(3 \times 10 \mathrm{~mL} \mathrm{mmol}^{-1}\right)$. The combined organic fractions were washed with satd. aq. $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ solution $\left(10 \mathrm{~mL} \mathrm{mmol}^{-1}\right)$. The organic washings were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and evaporated in vacuo to yield the
crude product. Purification by column chromatography on silica gel yielded the desired bicyclic compounds 9 .

## ( $\pm$ )-Tashiromine (1) and ( $\pm$ )-epitashiromine (2)

The diastereomeric mixture of ethyl $\left(8 R^{\star}, 8 \mathrm{a} R^{\star}\right)$-octahydroindolizine-8-carboxylate (12b') and ethyl ( $8 R^{\star}, 8 \mathrm{a} S^{\star}$ )-octahydroindolizine-8-carboxylate (12b") (0.675 g,
3.42 mmol ; dr $85: 15$ ) in $\mathrm{Et}_{2} \mathrm{O}$ ( 13.7 mL ) was added dropwise to a slurry of $\mathrm{LiAlH}_{4}$ ( $0.196 \mathrm{~g}, 5.13 \mathrm{mmol}$ ) in $\mathrm{Et}_{2} \mathrm{O}(23 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The mixture was warmed to rt and stirred for a further 16 h . The reaction was quenched by the sequential addition of $\mathrm{H}_{2} \mathrm{O}(0.8 \mathrm{~mL})$, aq. $\mathrm{NaOH}(0.8 \mathrm{~mL}, 15 \% \mathrm{w} / \mathrm{v})$ and finally $\mathrm{H}_{2} \mathrm{O}(2.4 \mathrm{~mL})$. The solids were removed by passing the mixture through a thin pad of celite. The filtrate was dried (anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ ), filtered and evaporated in vacuo to yield ( $\pm$ )-epitashiromine (2) and ( $\pm$ )-tashiromine (1) in the ratio $87: 13$ ( $0.464 \mathrm{~g}, 87 \%$ ). The two diastereomers were partially separated by flash column chromatography for characterisation using $\mathrm{MeOH} / \mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{NH}_{4} \mathrm{OH}$ 95:4.75:0.25 as eluent.
