## for

## Molecular recognition of N -acetyltryptophan enantiomers by $\boldsymbol{\beta}$-cyclodextrin

Spyros D. Chatziefthimiou, Mario Inclán, Petros Giastas, Athanasios Papakyriakou, Konstantina Yannakopoulou* and Irene M. Mavridis*<br>Address: Institute of Nanoscience \& Nanotechnology, National Center for Scientific Research "Demokritos", Patriarchou Gregoriou E' \& Neapoleos 27, Aghia Paraskevi Attikis, 15310 Greece<br>Email: Irene M. Mavridis - e.mavridis@inn.demokritos.gr<br>*Corresponding author

Experimental data containing geometry data of the $\beta$-CD hosts; H-bonding interactions in the $\beta$-CD dimer; NMR data (Job plots and 2D maps of the observed dipolar interactions); packing, origin selection and comparison of monomeric $\beta-C D$ complexes; modeling results of D-NAcTrp/ $\beta$-CD

## Contents

1. Geometry of the $\beta$-CD Complexes

Tables S1-S3.
2. Determination of the host/guest ratio by Job plots \& 2D ROESY NMR maps of the complexes overlayed

Figures S1-S3
3. Packing and origin selection of monomeric $\beta$-CD complexes

Figure S4.
4. Comparison of the structure of hydrated $\beta-C D$ with " $\beta-C D-D-N A c T r p$ " and other monomeric structures

Figures S5 and S6
5. Energy minimization of D-NAcTrp inside the dimer structure of the $\beta$-CD-L-NAcTrp complex.
Figure S7.

Table S1: Geometrical parameters of the $\beta-C D$ in the $\beta$-CD-L-NAcTrp complex

$\beta-C D$

Figure S1: Job plots of ${ }^{1} \mathrm{H}$ NMR signals of $\beta$-CD upon interaction with L-NAcTrp (left) and D-NAcTrp (right).

Figure S2: Job plots of ${ }^{1} \mathrm{H}$ NMR signals of L-NAcTrp (left) and D-NAcTrp (right) upon interaction with $\beta-C D$.

Figure S3: 2D maps of the observed dipolar, through space host-guest interactions (DNAcTrp = red contours; L-NAcTrp = blue contours) overlayed so that the strong intramolecular cross-peaks between $\mathrm{H} 9,9$ ' with H 6 and H 8 in each NAcTrp enantiomer are of equal intensity. (a) The differences observed concern through space interactions between guest protons H 8 and H 4 and host $\mathrm{H} 6,6$ and H 5 only, all other interactions being practically identical. (b) The acetate group shows through space dipolar interaction with $\beta$ CD H3 only, i.e., the NAc group is located exclusively near the wider secondary side of the host.

Figure S4: Packing ${ }^{1}$ of monomeric $\beta-C D$ complexes (left, in the ac plane and right in the bc plane). (A) " $\beta$-CD-D-NAcTrp"; (B) $\beta$-CD-Hydrate clathrate (BUVSEQ01) ${ }^{2}$ after transformation of axes from $\mathbf{a b c}$ to $\mathbf{c}(-\mathbf{b}) \mathbf{a}$. Note that if the origin in BUVSEQ01 is moved by $1 / 2 \mathrm{c}$ and by 0.429 b (new axes in bold), its coordinates would almost superpose with these of " $\beta$-CD-D-NAcTrp"; (C) $\beta$-CD-Hydrate (OXAGUQ) ${ }^{3}$ : The structure is the same as BUVSEQ01); (D) $\beta$-CD-Hydrate (GAGPOA) ${ }^{4}$. The structure superposes on " $\beta$-CD-DNAcTrp"after invertion of its coordinates.

Figure S5: Superposition of $\beta$-CD macrocycles in the asymmetric unit of " $\beta$-CD-DNAcTrp" and $\beta$-CD-Hydrate clathrate (BUVSEQ01) ${ }^{2}$ after (i) transformation of coordinates of BUVSEQ01 abc to $\mathbf{c}(-b) \mathbf{a}$ and (ii) change of origin of by $1 / 2 \mathbf{c}$ and by $0.429 b$. The two structures do not superposes exactly. The structures were rendered in PyMOL. ${ }^{5}$

Figure S6: Superposition (rendered in Coot $^{6}$ ) of one $\beta$-CD glucopyranose unit (glucose 1) in pairs of similar structures: (A) present structure " $\beta$-CD-D-NAcTrp" (green) and $\beta$-CDHydrate BUVSEQ01 ${ }^{2}$ (blue); (B) $\beta$-CD-Hydrates BUVSEQ01 (blue) and GAGPOA ${ }^{4}$ (yellow); (C) $\beta$-CD-Hydrates BUVSEQ01 (blue) and OXAFUQ (orange) ${ }^{3}$; (D) $\beta$-CDHydrate BUVSEQ01 (blue) and $\beta$-CD-glutaric acid ${ }^{7}$ (magenta). It is worth noting that in ( A ) the structures do not superpose exactly, whereas in (B), (C) and (D) they superpose completely.
