## Experimental procedures and characterization data of peptides

## General information

Reagents were purchased from Sigma Aldrich, Fluka, Propeptide, Novabiochem or Senn Chemicals and used without further purification. All the amino acid derivatives employed in this study displayed L absolute configuration. The milling treatments were carried out in a Retsch Mixer Mill 200. SPPS was performed at the "SynBio3 Platform" (IBMM, Université de Montpellier) using a Liberty Blue peptide synthesizer (CEM). Analyses were performed at the "Plateforme Technologique Laboratoire de Mesures Physiques" (IBMM, Université de Montpellier). ${ }^{1} \mathrm{H}$ NMR spectra were recorded either on a Bruker Avance I 300 MHz or on a Bruker Avance III HD 400 MHz spectrometer and are reported in ppm using residual solvent as an internal standard $\left(\mathrm{CDCl}_{3}\right.$ at $7.26 \mathrm{ppm}, \mathrm{DMSO}-d_{6}$ at $2.50 \mathrm{ppm}, \mathrm{CD}_{3} \mathrm{OD}$ at 3.31 ppm and $\mathrm{D}_{2} \mathrm{O}$ at 4.79 ppm$)$. Data are reported as $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quadruplet, $\mathrm{qt}=$ quintuplet, $\mathrm{m}=$ multiplet; coupling constant in Hz ; integration. ${ }^{13} \mathrm{C}$ NMR spectra were
recorded either on a Bruker Avance I 75 MHz or on a Bruker Avance III HD 101 MHz and are reported in ppm using residual solvent as an internal standard $\left(\mathrm{CDCl}_{3}\right.$ at 77.16 ppm , DMSO- $d_{6}$ at 39.52 ppm and $\mathrm{CD}_{3} \mathrm{OD}$ at 49.00 ppm ). Mass spectra were obtained by LCESIMS using a Waters Alliance 2695 as LC, coupled to a Waters ZQ spectrometer with electrospray source, a simple quadrupole analyzer and a UV Waters 2489 detector. Purity of products was determined by HPLC (Agilent technologies 1220 infinity LC) using Ony Monolithic HD-C18 $(50 \times 4.6 \mathrm{~mm})$ column and a UV detector $(\lambda=214 \mathrm{~nm})$; samples were injected with a volume of $5 \mu \mathrm{~L}$. The solvent system used water ( $0.1 \% \mathrm{TFA}$ ) and acetonitrile ( $0.1 \% \mathrm{TFA}$ ) as eluent with a flow of $3 \mathrm{~mL} / \mathrm{min}(0-100 \%$ in 3 min ).

4.0 equiv) and EtOAc ( $450 \mu \mathrm{~L}, \eta=2.37 \mu \mathrm{~L} / \mathrm{mg}$ ) were introduced in a 15 mL PTFE grinding jar equipped with one stainless steel ball ( 10 mm diameter). The jar was subjected to grinding for 2 min in the mixer mill operated at 25 Hz . Then, $N$-(3-Dimethylaminopropyl)- $N^{\prime}$ ethylcarbodiimide ( $26.4 \mu \mathrm{~L}, 0.149 \mathrm{mmol}, 1.2$ equiv) was added and the jar was subjected to grinding for 3 min in the mixer mill operated at 25 Hz . A first aliquot of the reaction mixture was withdrawn, immediately quenched with $1: 1 \mathrm{MeCN} / 1 \mathrm{~N}$ aqueous HCl solution and analyzed by HPLC to determine the conversion. The jar was subjected to further grinding in the mixer mill operated at 25 Hz until next aliquot was withdrawn. This operation was repeated until completion of the reaction.

To the reaction mixture was added EtOAc ( 30 mL ) and deionized water ( 25 mL ). The aqueous phase was extracted with $\operatorname{EtOAc}(2 \times 10 \mathrm{~mL})$ and the combined organic phase was washed with 1 N aqueous HCl solution $(2 \times 10 \mathrm{~mL}), 1 \mathrm{~N}$ aqueous NaOH solution $(2 \times 10 \mathrm{~mL})$ and saturated aqueous NaCl solution $(2 \times 10 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$, filtered, concentrated under vacuum to furnish the desired product as a white solid ( $57.4 \mathrm{mg}, 78 \%$ yield, $88 \%$ HPLC purity).

## Solid-phase peptide synthesis

The peptide chains were elongated by means of a Liberty Blue peptide synthesizer (CEM) employing standard Fmoc chemistry. The syntheses were conducted on a 0.1 mmol scale starting with Fmoc-Ala-Wang resin ( $0.8 \mathrm{mmol} / \mathrm{g}$ ) with a 5 -fold excess of Fmoc-protected Lamino acids ( 0.2 M in DMF, $2.5 \mathrm{~mL}, 0.5 \mathrm{mmol}, 5.0$ equiv), 0.5 M DIC in DMF ( $1 \mathrm{~mL}, 0.5$ $\mathrm{mmol}, 5.0$ equiv) as coupling reagent, 1 M Oxyma in DMF ( $0.5 \mathrm{~mL}, 0.5 \mathrm{mmol}, 5.0$ equiv) for 7 min at $70^{\circ} \mathrm{C}$. The deprotection steps were carried out with piperidine/DMF $1: 4(\mathrm{v} / \mathrm{v})(14$ $\mathrm{mL}, 28.3 \mathrm{mmol}, 283.5$ equiv) over 3 min at $70^{\circ} \mathrm{C}$. The second coupling and deprotection of Fmoc-Ile-Ala-OHMP was performed during 90 min at room temperature. After the assembly was complete, the peptide-resin was washed with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(70 \mathrm{~mL})$ and cleavage was performed with TFA/TIS/ $\mathrm{H}_{2} \mathrm{O}$ 94:3:3 ( 10 mL ) for 2 h at room temperature. The peptide was precipitated by adding cold $\mathrm{Et}_{2} \mathrm{O}$, the solution was decanted, and the solid was triturated with cold $\mathrm{Et}_{2} \mathrm{O}$, which was again decanted and filtrated. After lyophilization, the peptide was obtained as a fluffy white solid ( $28.0 \mathrm{mg}, 54 \%$ yield, $96 \%$ purity, MS (ESI): m/z 401.3 $\left.[\mathrm{M}+\mathrm{H}]^{+}\right)$.
