Experimental Details and Characterisation Data

## General Experimental

Infrared spectra were recorded either neat as thin films between sodium chloride discs, or as a Nujol mull between sodium chloride discs. The intensity of each band is described as $s$ (strong), $m$ (medium) or $w$ (weak) and with the prefix $v$ (very) and suffix br (broad) where appropriate. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}$-NMR spectra were recorded in $\mathrm{CDCl}_{3}$ unless stated otherwise, at 500 and $125 \mathrm{MHz}, 400$ and 100 MHz , or 300 and 75 MHz , respectively. Chemical shifts are reported as $\delta$ values (ppm) referenced to the following solvent signals: $\mathrm{CHCl}_{3}, \delta_{\mathrm{H}} 7.26 ; \mathrm{CDCl}_{3}, \delta_{\mathrm{C}} 77.0$. The term, 'stack' is used to describe a region where resonances arising from non-equivalent nuclei are coincident, and multiplet, m , to describe a region where a resonance arises from a single nucleus (or equivalent nuclei) but coupling constants cannot be readily assigned. In analysing $A B$ systems, where the resonance pattern forms two, wellseparated groups, each of two lines, these are separately reported as "A of $A B$ " and " $B$ of $A B$ ", along with $J_{A B}$. In analysing $A B X$ (and similar) systems, where the resonance pattern forms two, clearly separated groups of lines (two sets of four lines for an $A B X$ system), these are reported as " $A$ of $A B X$ " and " $B$ of $A B X$ ", along with $J_{A}$. B, which can be directly measured from the spectra. Whilst $J_{A-X}$ cannot strictly be measured directly from the spectrum, the value obtained from the spectrum is sufficiently close to the actual value for it still to be useful; however it is acknowledged that the values quoted for $J_{A-X}$ and $J_{B-X}$ are not the true values. Connectivities were deduced from COSY90, HSQC and HMBC experiments. GOESY experiments were used to elucidate relative stereochemistry. Mass spectra were recorded on a LCT spectrometer utilising electrospray ionisation (and a methanol mobile phase), or electron impact ionisation, and are reported as ( $\mathrm{m} / \mathrm{z}$ (\%)). HRMS were recorded on a LCT spectrometer using a lock mass incorporated
into the mobile phase. Melting points were determined using open capillaries and are uncorrected.

Preparative HPLC was performed on a reverse phase Phenomenex Luna 10u C18(2)100A $50 \times 21,20 \mathrm{~mm} \times 10$ micron fitted with a Dionex P580 pump and a Dionex UVD170S detector (used at 210 and 225 nm ) using a helium-degassed HPLC grade water/acetonitrile gradient, without acidic additives. Elution was monitored and spectra were recorded on Dionex Chromeleon 6.11 software.

Reactions were monitored by thin layer chromatography using pre-coated glassbacked silica plates (60A $\mathrm{F}_{254}$ ) and visualised by UV detection (at 254 nm ) and with ammonium molybdate(IV) - cerium(IV) sulfate staining dip or potassium manganate(VII) staining dip or 2,4-dinitrophenylhydrazine staining dip (for aldehydes). Column chromatography was performed on silica gel (particle size 40$63 \mu \mathrm{~m}$ mesh).

All reactions were conducted in oven-dried $\left(140^{\circ} \mathrm{C}\right)$ or flame-dried glassware under a nitrogen atmosphere, and at ambient temperature ( 20 to $25^{\circ} \mathrm{C}$ ) unless otherwise stated, with magnetic stirring. Volumes of 1 mL or less were measured and dispensed with gastight syringes. Evaporation and concentration under reduced pressure was performed at 50-500 mbar. Residual solvent was removed under high vacuum (1 mbar).

All reagents were obtained from commercial sources and used without further purification unless stated otherwise. Trimethylsilyl trifluoromethanesulfonate (triflate) was stored in a Schlenk tube under nitrogen at $4{ }^{\circ} \mathrm{C}$ and used whilstever the
compound was colourless. Over time, a pink colouration was observed whereupon fresh TMSOTf was used. Dichloromethane and cyclohexane were freshly distilled under nitrogen from $\mathrm{CaH}_{2}$. Diethyl ether was freshly distilled under nitrogen from sodium benzophenone ketyl. Toluene was freshly distilled from sodium. ${ }^{i} \mathrm{Pr}_{2} \mathrm{NH}$ was distilled under a nitrogen atmosphere from KOH and stored under nitrogen at room temperature over activated $4 \AA$ molecular sieves. All solutions are aqueous and saturated unless stated otherwise. TMSCI was distilled under nitrogen from $\mathrm{CaH}_{2}$. 2,4,6-Tri-tert-butylpyrimidine (TTBP) was synthesised following a known procedure.[1] Dess Martin Periodinane was synthesised according to a known procedure.[2,3]

## Allylation reaction of Aldehyde syn-4b

TMSOTf ( $80 \mu \mathrm{~L}, 0.47 \mathrm{mmol}$ ) was added to a solution of aldehyde syn-4b (150 mg, 0.41 mmol ) and TTBP ( $134 \mathrm{mg}, 0.54 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ and the reaction was stirred for 24 h . The reaction was quenched by the addition of $\mathrm{NaHCO}_{3}$ solution ( 5 mL ) at $-78^{\circ} \mathrm{C}$ and then the reaction mixture was allowed to warm to room temperature over 30 min . The two phases were separated and the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 5 \mathrm{~mL})$. The combined organic extracts were washed with water ( 5 mL ) and brine ( 5 mL ) and dried over $\mathrm{MgSO}_{4}$. Filtration and evaporation under reduced pressure afforded a colourless oil. TTBP was removed by flash column chromatography (hexane) to afford diene syn-13b and 4 diastereoisomeric
oxasilacycles 16b, 17b, 18b and 19b (16b:17b:18b:19b:syn-13b, 1:1:1:1:3) (134 $\mathrm{mg}, 89 \%$ ). Flash column chromatography (10\% toluene in hexane) afforded pure diene syn-13b. The oxasilacycles were inseparable by flash column chromatography. Analytically pure samples of each diastereoisomer were obtained by preparative HPLC.

## Allylation reaction of Aldehyde anti-4b

TMSOTf (160 $\mu \mathrm{L}, 0.94 \mathrm{mmol})$ was added to a solution of aldehyde anti-4b ( 300 mg , $0.83 \mathrm{mmol})$ and TTBP (268 mg, 1.08 mmol$)$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ and the reaction was stirred for 10 h . The reaction was quenched by the addition of $\mathrm{NaHCO}_{3}$ solution ( 10 mL ) at $-78{ }^{\circ} \mathrm{C}$ and then the reaction mixture was allowed to warm to room temperature over 30 min . The two phases were separated and the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 10 \mathrm{~mL})$. The combined organic extracts were washed with water ( 10 mL ) and brine ( 10 mL ) and dried over $\mathrm{MgSO}_{4}$. Filtration and evaporation under reduced pressure afforded a colourless oil. TTBP was removed by flash column chromatography (hexane) to afford diene anti-13b and 2 diastereoisomeric oxasilacycles 14b and 15b (14b:15b:anti-13b, 4:1:3) (273 mg, 91\%). Flash column chromatography ( $10 \% \mathrm{PhCH}_{3}$ in hexane) afforded pure diene anti-13b. The two oxasilacycles were inseparable by flash column chromatography. Analytically pure samples of each diastereoisomer were obtained by preparative HPLC.

## Allylation reaction of Aldehyde syn-4a

TMSOTf ( $90 \mu \mathrm{~L}, 0.53 \mathrm{mmol}$ ) was added to a solution of aldehyde syn-4a ( 158 mg , 0.46 mmol ) and TTBP ( $151 \mathrm{mg}, 0.61 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(6 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ and the reaction mixture was stirred for 24 h . The reaction was then quenched by the addition of $\mathrm{NaHCO}_{3}$ solution (6 mL) at $-78^{\circ} \mathrm{C}$ and then the resulting mixture was allowed to warm to room temperature over 30 min . The two phases were separated
and the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 6 \mathrm{~mL})$. The combined organic extracts were washed with water ( 6 mL ) and brine ( 6 mL ) and dried over $\mathrm{MgSO}_{4}$. Filtration and evaporation under reduced pressure afforded a colourless oil. TTBP was removed by flash column chromatography (hexane) to afford diene syn13a and four diastereoisomeric oxasilacycles 16a,17a,18a and 19a (16a:17a:18a:19a:syn-13a, 1:1:1:1:5) (148 mg, 94\%). Flash column chromatography (10\% toluene in hexane) afforded pure diene syn-13a. The oxasilacycles were inseparable by flash column chromatography. Analytically pure samples of each diastereoisomer were obtained by preparative HPLC.

## Allylation reaction of Aldehyde anti-4a

TMSOTf ( $100 \mu \mathrm{~L}, 0.66 \mathrm{mmol}$ ) was added to a solution of aldehyde anti- $\mathbf{4 a}$ ( 175 mg , 0.51 mmol ) and TTBP ( $168 \mathrm{mg}, 0.68 \mathrm{mmol}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(7 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$ and the reaction was stirred for 6 h . The reaction was quenched by the addition of $\mathrm{NaHCO}_{3}$ solution ( 7 mL ) at $-78^{\circ} \mathrm{C}$ and then the reaction mixture was allowed to warm to room temperature over 30 min . The two phases were separated and the aqueous phase was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 7 \mathrm{~mL})$. The combined organic extracts were washed with water $(7 \mathrm{~mL})$ and brine $(7 \mathrm{~mL})$ and dried over $\mathrm{MgSO}_{4}$. Filtration and evaporation under reduced pressure afforded a colourless oil. TTBP was removed by flash column chromatography (hexane) to afford diene anti-13a and 2 diastereoisomeric oxasilacycles 14a and 15a (14a:15a:anti-13a, 4:1:3) (159 mg, 91\%). Flash column chromatography (10\% $\mathrm{PhCH}_{3}$ in hexane) afforded pure diene anti-13a. The oxasilacycles were inseparable by flash column chromatography. Analytically pure samples of each diastereoisomer were obtained by preparative HPLC.
