Experimental procedures and characterization data

Compounds $\mathbf{2 1}{ }^{[1]}, \mathbf{2 3}{ }^{[2]}, \mathbf{2 5}{ }^{[3]}, \mathbf{4 1}{ }^{[4]}$ and $\mathbf{4 3}{ }^{[5]}$ were prepared following literature procedures.

## (S)-3-Phenylbutanamide

$\mathrm{Boc}_{2} \mathrm{O}(558 \mathrm{mg}, 2.55 \mathrm{mmol}), \mathrm{NH}_{4} \mathrm{HCO}_{3}(186 \mathrm{mg}, 2.36 \mathrm{mmol})$ and pyridine $(96 \mu \mathrm{~L}, 1.18$ mmol ) were added to a solution of (S)-3-phenylbutyric acid (323 mg, 1.97 mmol ) in anhydrous $\mathrm{CH}_{3} \mathrm{CN}(10 \mathrm{~mL})$. The resulting mixture was stirred at r.t. under an atmosphere of argon for 16 h . After complete consumption of the starting material (as indicated by TLC) all the volatile components were removed under reduced pressure. The residue was dissolved in EtOAc and water added. The phases were separated and the aqueous layer was extracted with EtOAc. The combined organic layers were washed with brine, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, evaporated and the product used without further purification.

## (S)-3-Phenylbutanenitrile (38)

[^0]

Cyanuric choride (56 mg, 0.30 mmol ) was added to a solution of (S)-3phenylbutanamide ( $75 \mathrm{mg}, 0.46 \mathrm{mmol}$ ) in DMF $(2.5 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The mixture was slowly allowed to reach r.t. and stirring at that temperature continued overnight. The reaction was quenched by the addition of water and diluted with EtOAc. The phases were separated and the aqueous layer was extracted with EtOAc. The combined organic layers were dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and evaporated. The residue was purified by flash column chromatography on silica gel (eluent: hexane:EtOAc 7:3) to provide 38 (54 $\mathrm{mg}, 81 \%)$ as a colorless oil.

According to procedure 1, methoxyallene ( 0.15 mL , 1.85 mmol ), $n$-BuLi ( 2.5 m in hexanes, $0.65 \mathrm{~mL}, 1.63 \mathrm{mmol}$ ), pivalonitrile ( $51 \mathrm{mg}, 0.60 \mathrm{mmol}$ ) and ( $(S)-\alpha$-methoxy(trifluoromethyl)phenylacetic acid ( $843 \mathrm{mg}, 3.60 \mathrm{mmol}$ - dissolved in the minimum amount of DMF were reacted to afford the intermediate $\beta$-ketoenamide, which was then treated with TMSOTf ( $0.70 \mathrm{~mL}, 3.60 \mathrm{mmol}$ ) and $\mathrm{NEt}_{3}(0.50 \mathrm{~mL}, 3.60 \mathrm{mmol})$. The crude material was purified by flash column chromatography on silica gel (eluent: hexane/ethyl acetate $\mathbf{8 0 : 2 0 )}$ to give $68 \mathrm{mg}(30 \%)$ of $\mathbf{2 0}$ as a colorless oil. Compound $\mathbf{2 0}$ was found to be in equilibrium with the corresponding pyridone. The ratio estimated by ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right)$ is $25: 75$ in favour of the pyridine tautomer. Pyridone: ${ }^{1} \mathrm{H}$ NMR $(250 \mathrm{MHz}$, $\mathrm{CDCl}_{3}$ ): $\delta=1.43$ (s, $9 \mathrm{H}, t-\mathrm{Bu}$ ), 3.39 (br. s, $3 \mathrm{H}, \mathrm{OMe}$ ), 3.93 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{OMe}$ at $\mathrm{C}-3$ ), 6.09 (s, $1 \mathrm{H}, 5-\mathrm{H}$ ), $7.35-7.50$ (m, $5 \mathrm{H}, \mathrm{Ph}$ ), 8.91 (br. s, $1 \mathrm{H}, \mathrm{NH}$ ) ppm. Pyridinol: ${ }^{1} \mathrm{H}$ NMR ( 250 $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=1.17$ (s, $9 \mathrm{H}, t-\mathrm{Bu}$ ), 3.39 (br. s, $3 \mathrm{H}, \mathrm{OMe}$ ), 3.52 (s, 3 H , OMe at $\mathrm{C}-3$ ), 7.35-7.50 (m, 6 H, Ph, 5-H), 7.99 (br. s, 1 H, OH) ppm.

Since 20 could not completely be separated from unidentified side products, it was converted into the corresponding nonaflate 52. Compound 20 ( $68 \mathrm{mg}, 0.18 \mathrm{mmol}$ ) was dissolved in dry THF ( 0.11 mL ) and treated with $\mathrm{NaH}(15 \mathrm{mg}, 0.37 \mathrm{mmol})$. NfF ( $67 \mu \mathrm{~L}$, 0.37 mmol ) was added and stirred for 10 h . After complete conversion of the starting
material (as indicated by TLC), the reaction was quenched by the addition of MeOH . The aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}$, dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and the solvent removed under reduced pressure. The crude product was purified by flash column chromatography on silica gel (eluent: hexane/ethyl acetate 100:0 to 70:30, linear gradient) to afford 61 mg ( $56 \%$ ) of 52 as a colorless oil.

## 2,6-Bis $\{(2 R, 6 R)$-[tert-butyldimethylsiloxy)(phenyl)methyl]-3-methoxypyridin-4(1H)one (35)

A solution of $n-\mathrm{BuLi}(2.5 \mathrm{M}$ in hexanes, $1.58 \mathrm{~mL}, 3.95 \mathrm{mmol})$ was added dropwise to a solution of methoxyallene ( $0.36 \mathrm{~mL}, 4.4 \mathrm{mmol}$ ) in $\mathrm{Et}_{2} \mathrm{O}(10 \mathrm{~mL})$ at $-40^{\circ} \mathrm{C}$. After 30 min , rac-2-(tert-butyldimethylsiloxy)-2-phenylacetonitrile (33) (360 mg, 1.46 mmol ) was added and the mixture stirred at $-50^{\circ} \mathrm{C}$ for 3 h . Then the mixture was cooled to $-78{ }^{\circ} \mathrm{C}$ and (R)-2-(tert-butyldimethylsiloxy)-2-phenylacetic acid (29) (2.33 g, 8.75 mmol$)$ dissolved in $\mathrm{Et}_{2} \mathrm{O}(2 \mathrm{~mL})$ added. The mixture was stirred overnight during which time it was slowly allowed to reach r.t. The reaction was quenched by the addition of aq. sat. $\mathrm{NaHCO}_{3}(15 \mathrm{~mL})$, the phases were separated and the aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 20 \mathrm{~mL})$. The combined organic layers were dried with $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and the solvent was removed under reduced pressure. The crude product was purified by flash column chromatography (silica gel, hexane/EtOAc $=9: 1$ to $8: 2$ ) to provide 482 mg (58\%) of the $\beta$-methoxy- $\beta$-ketoenamide. Following the typical procedure, the $\beta$-methoxy-$\beta$-ketoenamide ( $70 \mathrm{mg}, 0.12 \mathrm{mmol}$ ) was cyclized with TMSOTf ( $0.07 \mathrm{~mL}, 0.36 \mathrm{mmol}$ ) and $\mathrm{NEt}_{3}(0.06 \mathrm{~mL}, 0.36 \mathrm{mmol})$ in 1,2-dichloroethane $(2.5 \mathrm{~mL})$ at $70^{\circ} \mathrm{C}$ for 1 d . The title compound and the corresponding diastereomer (15 mg each, 22\% each; 26\% over 2 steps for both diastereomers) were obtained pure after flash column chromatography on
silica gel (eluent: hexane: EtOAc 8:2 to 7:3 linear gradient). $[\alpha]_{D}^{22}=-47.1$ ( $c=0.7$, $\left.\mathrm{CHCl}_{3}\right) \cdot{ }^{1} \mathrm{H}$ NMR ( $700 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=-0.03,0.03,0.07,0.10(4 \mathrm{~s}, 3 \mathrm{H}$ each, OTBS), 0.90, 0.94 (2 s, 9 H each, OTBS), 3.72 (s, $3 \mathrm{H}, \mathrm{OMe}$ ), 5.57, 6.12 (2 s, 1 H , each, CHPh), $6.24(\mathrm{~s}, 1 \mathrm{H}, 5-\mathrm{H}), 7.23-7.36(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Ph}) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR (176 MHz, $\left.\mathrm{CDCl}_{3}\right): \delta=-5.05$, -4.98, -4.84, -4.77 (4 q, OTBS), 18.23, 18.27 ( $2 \mathrm{~s}, \mathrm{OTBS}$ ), 25.8 ( q, OTBS), 58.9 ( q, OMe), 69.0, 72.7 (2 d, CHPh), 114.5 (d, C-5), 126.0, 126.1, 128.1, 128.5, 128.6, 128.8 ( $6 \mathrm{~d}, \mathrm{Ph}$ ), 140.8 ( $\mathrm{s}, \mathrm{Ph}$ ), 141.2 (s, C-3), 143.5, 147.9 (s, C-2/6), 175.0 (s, C-4) ppm. ## General Procedure for the O-Methylation of 4-Hydroxypyridines (Procedure 5)

NaH in mineral oil ( $60 \mathrm{wt}-\%, 3.0$ equiv.) was washed with hexane (three times) and suspended in anhydrous THF ( $2.0 \mathrm{~mL} / \mathrm{mmol} 4$-hydroxypyridine). A solution of the 4hydroxypyridine in THF ( $2.0 \mathrm{~mL} / \mathrm{mmol}$ 4-hydroxypyridine) was added dropwise. After 5 min stirring at r.t., methyl iodide (3.0 equiv.) was added and the reaction mixture stirred at ambient temperature overnight. After complete consumption of the starting material (as indicated by TLC), the reaction was quenched by the slow addition of MeOH until hydrogen production had ceased. Water and ethyl acetate were added, the organic layer was separated and the aqueous phase extracted with ethyl acetate. The combined organic layers were dried with anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and the solvent was removed under reduced pressure. The crude material was purified by flash column
chromatography on silica gel using an appropriate mixture of ethyl acetate and hexane as eluent.
