## Experimental section

## General Information

All reactions were carried out in oven-dried glassware $\left(100{ }^{\circ} \mathrm{C}\right)$ under nitrogen atmosphere unless otherwise stated. Septa, disposable syringes and needles were used for the transfer of reagents and other liquid chemicals. For drying of organic phases water-free sodium sulfate was used.
${ }^{1} \mathrm{H}$ NMR-spectra were measured on a 400 MHz NMR spectrometer from Bruker (model AV-400). $\mathrm{CDCl}_{3}$ was used as the solvent. The solvent peak was calibrated at 7.26 ppm . The analysis of spectra was performed with PC-software MestRe-C. The abbreviations used in the interpretation of NMR spectra are: $s=$ singlet, $d=$ doublet, $\mathrm{dd}=$ doublet of doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{m}=$ multiplet or $\mathrm{br}=$ broad. Chemical shifts are $\delta$-values and were measured in ppm.
${ }^{13} \mathrm{C}$ NMR-spectra were also measured at a frequency of 100 MHz on a NMR spectrometer from Bruker (model AV-400). $\mathrm{CDCl}_{3}$ was used as the solvent. The solvent peak was calibrated at 77.0 ppm . The analysis of spectra was done with PCsoftware MestRe-C. The abbreviations used for analysis are: $s=$ singlet, $d=$ doublet, $t=$ triplet, $q=$ quartet. Chemical shifts were $\delta$-values and were measured in ppm.

Preparative flash column chromatography was performed through columns packed with silica gel grade $60(35-70 \mu \mathrm{~m})$ purchased from Macherey-Nagel.

Melting points were measured in open glass capillaries on apparatus MEL-TEMP II purchased from Laboratory Devices and are uncorrected.

Thin-layer chromatography was performed with commercially available precoated Polygram® SIL-G/UV 254 plates purchased from Fluka. The detection of spots was achieved under UV-light, $\mathrm{I}_{2}$-vapours or $\mathrm{KMnO}_{4}$ solution.

High Pressure liquid chromatography was performed on the instrument purchased from Shimadzu (model 10A VP). As an achiral column, LiChrosorb Si-60 (250-4, diameter $5 \mu \mathrm{~m}$ ) was used (Phenomenex). The evaluation was performed with Class VP-Software (Schimadzu).

Elemental analyses were performed at the Institute for Organic Chemistry, University of Saarland on the instrument Leco (model CHN900).

High resolution mass spectrometry (HRMS) was performed at the Institute for Organic Chemistry, University of Saarland on a MAT 95Q (Finnigan). The fragmentation was carried out through chemical ionization (CI) or electron ionization (EI).

Solvents were dried by refluxing the corresponding solvent over suitable drying agent. Tetrahydrofuran (THF) was dried over lithium aluminium hydride (LAH), dichloromethane (DCM) was dried over powdered $\mathrm{CaH}_{2}$. Commercial grade solvents, such as ethyl acetate, hexane, and diethyl ether, were distilled prior to use.

## tert-Butyl 2-(2,2,2-trifluoroacetamido)acetate (TFA-Gly-Ot-Bu)

In a three neck flask with an intensive cooler and cryostat, ammonia gas was condensed ( $\sim 400 \mathrm{ml}$ ) at $-78{ }^{\circ} \mathrm{C}$. Under a nitrogen atmosphere tert-butyl bromoacetate ( $100 \mathrm{~g}, 0.51 \mathrm{~mol}$ ) was added dropwise. The reaction mixture was stirred for 2 days at $-78{ }^{\circ} \mathrm{C}$ and then it was warmed up to r.t. and the excess of ammonia was evaporated. The resulting solid was filtered off and was washed with diethyl ether. The filtrate was evaporated and the crude product was purified by bulb-to-bulb distillation ( $p=10$ torr, $b p=50^{\circ} \mathrm{C}$ ) giving rise to tert-butyl glycinate as a clear oil in $72 \%$ yield ( $48.6 \mathrm{~g}, 0.37 \mathrm{~mol}$ ).
tert-Butyl glycinate ( $10.0 \mathrm{~g}, 76.2 \mathrm{mmol}$ ) was dissolved in methanol ( 250 ml ). At $0^{\circ} \mathrm{C}$ triethylamine ( $15.4 \mathrm{~g}, 153 \mathrm{mmol}$ ) was added, and finally methyl trifluoroacetate $(21.7 \mathrm{~g}, 153 \mathrm{mmol})$ in methanol ( 100 ml ) was added. The reaction mixture was allowed to warm up to r.t. overnight and then the methanol was evaporated. The resulting residue was dissolved in ethyl acetate and washed with water. The organic phase was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and the solvent was evaporated. The crude product was
purified by bulb-to-bulb distillation ( $\mathrm{p}=3$ torr, $\mathrm{bp}=86^{\circ} \mathrm{C}$ ) and resulting in a clear oil in $84 \%$ yield ( $14.5 \mathrm{~g}, 64.0 \mathrm{mmol}$ ).

${ }^{1} \mathrm{H}$ NMR (400 MHz, $\left.\mathrm{CDCl}_{3}\right): \delta=6.86(\mathrm{~s}, 1 \mathrm{H}, \mathrm{NH}), 4.01\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{2, \mathrm{NH}}=4.9 \mathrm{~Hz}, 2 \mathrm{H}, 2-\mathrm{H}\right)$, 1.49 (s, 9H, 6-H). ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=167.3(\mathrm{C}-1), 156.6\left(\mathrm{~J}_{3, \mathrm{~F}}=37.5 \mathrm{~Hz}\right.$, $\mathrm{C}-3), 116.6\left(\mathrm{~J}_{4, \mathrm{~F}}=287 \mathrm{~Hz}, \mathrm{C}-4\right), 83.6(\mathrm{C}-5), 42.0(\mathrm{C}-2), 27.9(\mathrm{C}-6)$.

## General procedure for ring opening reactions of epoxides ${ }^{1}$

In a Schlenk tube hexamethyldisilazane ( $497 \mathrm{mg}, 3.08 \mathrm{mmol}$ ) was dissolved in dry THF ( 5.0 ml ). The solution was cooled to $-78^{\circ} \mathrm{C}$, and then a 1.6 M solution of $n-\mathrm{BuLi}$ ( $1.72 \mathrm{ml}, 2.75 \mathrm{mmol}$ ) was added slowly. The solution was stirred for 10 min and the cooling bath was then removed and the solution was stirred for a further 10 min . In a second Schlenk flask $\mathrm{ZnCl}_{2}$ ( $180 \mathrm{mg}, 1.32 \mathrm{mmol}$ ) was dried with a heat gun under vacuum, and dissolved in THF ( 5.0 ml ). The solution was cooled to room temperature, then Tfa-Gly-Ot-Bu ( $250 \mathrm{mg}, 1.1 \mathrm{mmol}$ ) was added and the mixture was cooled to $-78^{\circ} \mathrm{C}$. The LHMDS solution was then added slowly. The resulting solution was stirred for 30 min at $-78^{\circ} \mathrm{C}$. Then the corresponding epoxide ( 1.65 mmol ) was added, followed by the addition of $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}(78.1 \mathrm{mg}, 0.55 \mathrm{mmol})$. The reaction mixture was allowed to warm to r.t. overnight and then it was hydrolyzed with 1 M HCl and extracted thrice with ethyl acetate. The combined organic layers were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, the solvent was evaporated in vacuo, and the crude product was purified by flash chromatography (silica gel, hexanes/EtOAc).

## tert-Butyl 4-hydroxy-2-(2,2,2-trifluoroacetamido)pentanoate (1a) ${ }^{1}$

According to the general procedure for epoxide openings TFA-Gly-Ot-Bu ( 250 mg , 1.1 mmol ), propylene oxide ( $128 \mathrm{mg}, 2.2 \mathrm{mmol}$ ), hexamethyldisilazane ( $497 \mathrm{mg}, 3.08$ $\mathrm{mmol}, 2.8$ equiv), $n$-BuLi ( $1.72 \mathrm{ml}, 2.75 \mathrm{mmol}, 2.5$ eq.) and $\mathrm{BF}_{3} . \mathrm{OEt}_{2}(172 \mathrm{mg}, 1.2$ mmol ) were allowed to react to give 1a after flash chromatography (silica, hexanes/EtOAc 8:2) in $92 \%$ yield ( $289 \mathrm{mg}, 1.01 \mathrm{mmol}$ ) as a colorless oil. [TLC: DCM/Hex 95:5, $\left.R_{f}=0.28\right]$.

## General procedure for Dess-Martin oxidations

To a solution of the corresponding $\gamma$-hydroxy amino acid ester 1 or 4 ( 1.32 mmol ) in dry dichloromethane, Dess-Martin periodinane ( $721 \mathrm{mg}, 1.7 \mathrm{mmol}$ ) was added at $0^{\circ} \mathrm{C}$ under nitrogen and the mixture was stirred at room temperature for 3 h . The reaction was quenched with a saturated solution of $\mathrm{NaHCO}_{3}$ containing $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$, and then the mixture was extracted with dichloromethane. The organic layers were
washed with a saturated solution of NaCl , dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The corresponding $\gamma$-keto amino acid ester was obtained after column chromatography (silica gel, EtOAc/hexane).

## General procedure for Swern oxidations

To a solution of oxalyl chloride ( $67 \mathrm{mg}, 0.52 \mathrm{mmol}$ ) in dry dichloromethane ( 0.5 ml ) at $-78{ }^{\circ} \mathrm{C}$, DMSO ( $82.8 \mathrm{mg}, 1.06 \mathrm{mmol}$ ) was added, the solution was stirred for 10 min , and then a solution of the corresponding $\gamma$-hydroxy amino acid ester 1 (0.26 mmol ) was added dropwise. The reaction mixture was stirred at the same temperature for another 1 h and then triethylamine ( $134 \mathrm{mg}, 1.32 \mathrm{mmol}$ ) was added. The cooling bath was removed after 15 min , and the reaction mixture was allowed to warm to room temperature. Water ( 5 ml ) was added and the reaction mixture was stirred for an additional 10 min . The reaction mixture was extracted with dichloromethane, the organic layers were washed with 1 N HCl , saturated NaCl soln., dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent was removed in vacuo. The corresponding $\gamma$-keto amino acid ester was obtained after column chromatography (silica gel, EtOAc/ hexane).

## tert-Butyl 4-oxo-2-(2,2,2-trifluoroacetamido)pentanoate (2a)

According to the general procedure for Dess-Martin oxidations alcohol 1a (377 $\mathrm{mg}, 1.32 \mathrm{mmol}$ ) and Dess-Martin periodinane ( $721 \mathrm{mg}, 1.7 \mathrm{mmol}$ ) were reacted to give 2a after flash chromatography (silica, hexanes/EtOAc 8:2) in 91\% yield ( 340 mg , 1.20 mmol ) as a colorless oil. [TLC: Hex/EA 75:25, $R_{\mathrm{f}}=0.53$ ].

## General procedure for Passerini reactions

To a sample of pure $\gamma$-keto amino acid ester 2 or the aldehydes 5 and 7 (0.27 mmol ) under $\mathrm{N}_{2}$ in a 5 ml round bottom flask, acetic acid ( $17.6 \mathrm{mg}, 0.29 \mathrm{mmol}$ ) and the corresponding isonitrile ( 0.29 mmol ) were added. The resulting homogeneous solution was stirred at r.t. under nitrogen for 20 h . The crude product was purified by column chromatography (silica gel, EtOAc/hexane).

## tert-Butyl 4-acetoxy-4-(chloromethyl)-5-(2-methoxy-2-oxoethylamino)-5-oxo-2-(2,2,2-trifluoroacetamido)pentanoate (3b)

According to the general procedure for Passerini reactions ketone $\mathbf{2 b}$ ( $86 \mathrm{mg}, 0.27$ mmol ), acetic acid ( $17.6 \mathrm{mg}, 0.29 \mathrm{mmol}$ ) and methyl 2 -isocyanoacetate ( $29 \mathrm{mg}, 0.29$ mmol ) were reacted to give $\mathbf{3 b}$ after flash chromatography (silica, hexanes/EtOAc $8: 2$ ) in $65 \%$ yield ( $84 \mathrm{mg}, 0.18 \mathrm{mmol}$ ) as white solid with a melting point of $93^{\circ} \mathrm{C}$.
