Strains, growth conditions, and feeding experiments: Micromonospora aurantiaca ATCC 27029 was cultivated at $28^{\circ} \mathrm{C}$ in GYM 65 liquid medium (glucose: 4 $\mathrm{g} \mathrm{L}^{-1}$, yeast extract: $4 \mathrm{~g} \mathrm{~L}^{-1}$, malt extract: $10 \mathrm{~g} \mathrm{~L}^{-1}$, agar: $12 \mathrm{~g} \mathrm{~L}^{-1}, \mathrm{pH}=7.2$ ) for $3-4$ days. The GYM medium for the agar plates was additionally supplemented with calcium carbonate $\left(2 \mathrm{~g} \mathrm{~L}^{-1}\right)$. The agar plates were inoculated with $1000 \mu \mathrm{~L}$ of the preculture, and spiked for feeding experiments with 2 mm of the respective deuterated precursor ( $\left[{ }^{2} \mathrm{H}_{10}\right]$-L-isoleucine, $\left[{ }^{2} \mathrm{H}_{10}\right]$-D,L-leucine, $\left[{ }^{2} \mathrm{H}_{8}\right]$-L-valine, [methyl$\left.{ }^{2} \mathrm{H}_{3}\right]$-L-methionine, or $\left[{ }^{2} \mathrm{H}_{5}\right.$ ]sodium propionate), incubated for $2-3$ days at $37^{\circ} \mathrm{C}$, and then analysed by closed-loop stripping analysis (CLSA) at $37^{\circ} \mathrm{C}$.

Collection of volatiles [1]: The volatiles emitted by the agar plate cultures were collected by use of a closed-loop stripping apparatus (CLSA). Therefore, a circulating air flow was directed through a charcoal filter (Chromtech GmbH, Idstein, Precision Charcoal Filter, 5 mg ) in a closed apparatus containing the agar plate, for 24 h . The charcoal filter was extracted with $20 \mu \mathrm{~L}$ of analytically pure dichloromethane and the obtained solutions were immediately analysed by GC-MS.

GC-MS: GC-MS analyses were carried out on a HP7890A GC system connected to a HP5975C mass selective detector fitted with a HP-5 fused silica capillary column (30 $\mathrm{m}, 0.22 \mathrm{~mm}$ i. d., $0.25 \mu \mathrm{~m}$ film, Hewlett-Packard, Wilmington, USA). Conditions were as follows: inlet pressure: 67 kPa , He $23.3 \mathrm{~mL} \mathrm{~min}^{-1}$; injection volume $1 \mu \mathrm{~L}$; injector $250^{\circ} \mathrm{C}$; transfer line $300^{\circ} \mathrm{C}$; electron energy 70 eV . The GC was programmed as follows: $50^{\circ} \mathrm{C}$ ( 5 min isothermic), increasing at $5^{\circ} \mathrm{C} \mathrm{min}{ }^{-1}$ to $320^{\circ} \mathrm{C}$. Retention indices were determined from a homologous series of $n$-alkanes (C8-C32). The identification of compounds was performed by comparison of mass spectra to database spectra. Chiral GC analyses were performed by using a hydrodex-6-TBDMS fused silica capillary column ( $50 \mathrm{~m}, 0.25 \mathrm{~mm}$ i.d., $0.25 \mu \mathrm{~m}$ film, Macherey-Nagel).

General synthetic methods: Chemicals were purchased from Acros Organics (Geel, Belgium) or Sigma Aldrich Chemie GmbH (Steinheim, Germany) and used without further purification. Solvents were purified by distillation and dried according to standard methods. For all general procedures, the relative amounts of the reagents are given as equivalents (eq.) referring to the molar ratios of the compounds, and the relative amounts of the solvents are given as the final
concentrations of the transformed starting material (set to 1.0 eq.). Thin-layer chromatography was performed with 0.2 mm precoated plastic sheets Polygram® Sil G/UV254 (Machery- Nagel). Column chromatography was carried out using Merck silica gel 60 (70-200 mesh). ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker AMX400 spectrometer and IR spectra were recorded with a Bruker Tensor 27 ATR. GC-MS analyses were carried out with an Agilent 7890A connected to an Agilent 5975C inert mass detector fitted with a HP-5 MS or BPX-5 fused silica capillary column ( $25 \mathrm{~m}, 0.25 \mathrm{~mm}$ i. d., $0.25 \mu \mathrm{~m}$ film). Instrumental parameters were (1) inlet pressure: $77.1 \mathrm{kPa}, \mathrm{He} 23.3 \mathrm{~mL} \mathrm{~min}^{-1}$; (2) injection volume: $2 \mu \mathrm{~L}$; (3) transfer line: $300^{\circ} \mathrm{C}$; and (4) electron energy: 70 eV . The GC was programmed as follows: 5 $\min$ at $50^{\circ} \mathrm{C}$ increasing at $5{ }^{\circ} \mathrm{C} \mathrm{min}^{-1}$ to $320^{\circ} \mathrm{C}$, and operated in splitless mode. The carrier gas was He at $1 \mathrm{~mL} \mathrm{~min}^{-1}$. Retention indices / were determined from a homologous series of $n$-alkanes (C8-C38).

General procedure for the preparation of methyl esters via 1,4-addition to methyl acrylate [2]: To a solution of alkylmagnesium bromide, prepared from the alkyl bromide ( 1 m in THF, 1 eq.) and magnesium (1 eq.), DMAP (2 eq.) and $\mathrm{CuBr} \cdot \mathrm{SMe}_{2}$ (1 eq.) were added. The mixture was cooled to $-78^{\circ} \mathrm{C}$ and a mixture of methyl acrylate ( 1 m in THF, 1 eq.) and TMSCl ( 2 m in THF, 2 eq.) was added dropwise over 30 min . After the mixture had been stirred for 3 h at $-78^{\circ} \mathrm{C}$, diethyl ether and $\mathrm{HCl}(2 \mathrm{~N})$ were added. The aqueous phase was separated and extracted three times with diethyl ether. The combined organic layers were dried with $\mathrm{MgSO}_{4}$. The pure 1,4-adduct was obtained as a colourless liquid after solvent evaporation and column chromatography.

General procedure for the preparation of alcohols via reduction: A solution of the ester ( 0.8 m in $\mathrm{Et}_{2} \mathrm{O}, 1$ eq.) was added to a suspension of $\mathrm{LiAlH}_{4}\left(0.2 \mathrm{~m} \mathrm{in} \mathrm{Et}_{2} \mathrm{O}\right.$, 0.75 eq.). After being heated under reflux for 12 h the mixture was cooled to $0^{\circ} \mathrm{C}$ and $\mathrm{H}_{2} \mathrm{O}$ was added slowly until the $\mathrm{H}_{2}$ formation stopped. One spatula of $\mathrm{MgSO}_{4}$ was added and the mixture was stirred vigorously for 10 min . The precipitate was filtered off and the filter cake was washed excessively with $\mathrm{Et}_{2} \mathrm{O}$. After solvent evaporation and column chromatography on silica gel the pure alcohol was afforded as a colourless liquid.

General procedure for the preparation of bromides: Bromine (1.33 eq.) was added dropwise to a solution of triphenylphosphane ( 0.7 m in dichloromethane, 1.33 eq.) at $0^{\circ} \mathrm{C}$ until the yellow colour persisted. The alcohol (in dichloromethane) was added in one batch. After being stirred for 2 h at $0^{\circ} \mathrm{C}$, the reaction mixture was diluted with diethyl ether and washed with saturated $\mathrm{NaHSO}_{3}$ solution to remove excess bromine. The aqueous phase was separated and extracted three times with diethyl ether. The combined organic layers were dried with $\mathrm{MgSO}_{4}$, filtered and $2 / 3$ of the solvents were evaporated. Pentane was added and the precipitated triphenylphosphane oxide was filtered off. Evaporation of the solvents and column chromatography provided the pure bromide as a colourless liquid.

General procedure for $\alpha$-methylation of esters: To a cooled $\left(0^{\circ} \mathrm{C}\right)$ solution of diisopropylamine ( 0.13 m in THF, 1.1 eq.) $n$-butyllithium ( 1.6 m in Hexan, 1.1 eq.) was added slowly and stirred for 1 h at $0^{\circ} \mathrm{C}$. After being cooled to $-78^{\circ} \mathrm{C}$ the ester ( 1 eq .) was added and the solution was stirred for 30 min . lodomethane was added dropwise and the reaction mixture stirred for 2 h at $-78^{\circ} \mathrm{C}$. The mixture was allowed to warm to room temperature, the reaction was quenched with saturated $\mathrm{NH}_{4} \mathrm{Cl}$ solution, and the layers were separated. The aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}$, the combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered, and the solvents were evaporated. Column chromatography of the residue on silica gel afforded the methylated ester as a colourless liquid.

General procedure for the reduction of esters to aldehydes: A solution of the ester ( 0.4 m in $\mathrm{Et}_{2} \mathrm{O}$, 1 eq .) was cooled to $-78^{\circ} \mathrm{C}$ and DIBAH ( 1 m in Hexan, 1.4 eq .) was added slowly. The reaction was monitored with TLC and upon completion of the
reaction the solution was poured into an ice-cold, stirred solution of $\mathrm{HCl}(4 \mathrm{~N})$. After separation of the layers the aqueous phase was extracted three times with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic layers were dried with $\mathrm{MgSO}_{4}$, filtered, and the solvents were evaporated. Column chromatography of the residue on silica gel afforded the aldehyde as a colourless liquid.

General procedure for the preparation of $\alpha, \beta$-unsaturated methyl esters via Horner-Wadsworth-Emmons reaction: To a cooled $\left(0^{\circ} \mathrm{C}\right)$ solution of diisopropylamine ( 0.1 m in THF, 1.05 eq.) n-butyllithium ( 1.6 m in Hexan, 1.05 eq .) was added slowly and the solution stirred for 30 min at $0^{\circ} \mathrm{C}$. After being cooled to $78^{\circ} \mathrm{C}$ trimethylphosphonoacetate ( 1.05 eq.) was added and the solution was stirred for 1 h . The aldehyde ( 0.4 m in THF, 1 eq .) was added and the reaction mixture stirred for 3 h at $-78^{\circ} \mathrm{C}$. The mixture was allowed to warm to room temperature, the reaction was quenched with $\mathrm{H}_{2} \mathrm{O}$ and saturated NaCl solution, and the layers were separated. The aqueous layer was extracted with ethyl acetate, the combined organic layers were dried over $\mathrm{MgSO}_{4}$, filtered, and the solvents were evaporated. Column chromatography of the residue on silica gel afforded the $\alpha, \beta$-unsaturated methyl ester as a colourless liquid.

General procedure for hydrogenation of $\alpha, \beta$-unsaturated methyl esters: Upon addition of $\mathrm{Pt} / \mathrm{C}(5 \% \mathrm{Pt}$ on charcoal, 0.1 eq .) the $\alpha, \beta$-unsaturated methyl ester ( 0.1 m in $\mathrm{EtOH}, 1$ eq.) was hydrogenated for 1 h at $25^{\circ} \mathrm{C}$ and an $\mathrm{H}_{2}$ pressure of 40 bar. After filtration over celite the solvent was evaporated. Column chromatography of the residue on silica gel afforded the saturated ester as a colourless liquid.

Preparation of 5-methyloctanal (129): To a cooled solution $\left(-60^{\circ} \mathrm{C}\right)$ of oxalyl chloride ( $0.91 \mathrm{~mL}, 10.6 \mathrm{mmol}$ ) in dichloromethane ( 70 mL ), DMSO ( 1.51 mL , 21.3 mmol ) in dichloromethane ( 15 mL ) was added and the solution was stirred for 10 min . The alcohol $128(1.28 \mathrm{~g}, 8.86 \mathrm{mmol})$ in dichloromethane $(15 \mathrm{~mL})$ was added, and the solution stirred for 30 min . Upon the addition of $\mathrm{NEt}_{3}(6.30 \mathrm{~mL}, 44.3 \mathrm{mmol})$ and stirring for another 10 min the solution was allowed to warm to room temperature, and $\mathrm{H}_{2} \mathrm{O}(50 \mathrm{~mL})$ was added. After separation of the layers the aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 100 \mathrm{~mL})$ and the combined organic layers were dried with $\mathrm{MgSO}_{4}$, filtered, and the solvents were evaporated. The pure compound 129 ( $1.09 \mathrm{~g}, 7.63 \mathrm{mmol}, 86 \%$ ) was afforded as a colourless liquid after column chromatography on silica gel.

Preparation of 6-methyInonan-2-ol (130): The aldehyde 129 ( $1.21 \mathrm{~g}, 8.49 \mathrm{mmol}$ ) was added to a cooled $\left(0^{\circ} \mathrm{C}\right)$ solution of methylmagnesium bromide $(3.39 \mathrm{~mL}$, $10.2 \mathrm{mmol})$ in $\mathrm{Et}_{2} \mathrm{O}(20 \mathrm{~mL})$. The solution was allowed to warm to room temperature and after the solution was stirred for $12 \mathrm{~h}, \mathrm{HCl}(2 \mathrm{~N}, 40 \mathrm{~mL})$ was added. Upon separation of the layers the aqueous layer was extracted with ethyl acetate ( 3 x 40 mL ) and the solvents were evaporated. Column chromatography on silica gel afforded the alcohol 130 ( $0.99 \mathrm{~g}, 6.24 \mathrm{mmol}, 74 \%$ ) as a colourless liquid.
