**General Remarks:** All reactions requiring anhydrous conditions were carried out under a nitrogen atmosphere and the solvents were dried appropriately before use. R_f values refer to TLC on 0.25 mm silica gel plates. Microwave-assisted reactions were carried out in a CEM Discover (TM) single mode microwave reactor with an IR temperature sensor. CDCl_3 was used as solvent for NMR measurements. NMR data are reported in δ (ppm) from TMS at 25 °C and peak assignments were made on the basis of 1H–1H COSY and HMQC experiments. IR spectra were recorded in CDCl_3 solution unless otherwise specified. Accurate mass spectra were recorded on a LTQ-Orbitrap high-resolution mass spectrometer (Thermo, San Jose, CA, USA), equipped with a conventional ESI source. Bicyclopentanylidene (BCP) was prepared according to the previously published procedure.1

**6,7-Dimethoxy-3,4-dihydroisoquinoline 2-oxide (6)**

NaHCO_3 (5.55 g, 66 mmol) was added to a stirred suspension of isoquinoline 5 (2.55 g, 13.2 mmol) in a 4:1 mixture of MeCN/THF (24 mL) and aqueous Na_2EDTA (0.01 M, 18.4 mL). The mixture was then cooled in an ice bath and Oxone® (10 g, 16.25 mmol) added portionwise over 4.5 h. The mixture was stirred at 0 °C for 45 min, then diluted with EtOAc (20 mL) and H_2O (20 mL). The two phases were separated and the aqueous solution extracted with CH_2Cl_2 (4 x 20 mL). The combined organic phases were dried over Na_2SO_4, filtered and concentrated under reduced pressure to afford the crude nitrone. Recrystallization from CH_2Cl_2 /petroleum ether and chromatography on silica gel (eluent: EtOAc/MeOH, first 2:1, then 3:2) of the compound recovered from the recrystallization mother liquors gave analytically pure 6 (1.83 g, 66%) as a yellow solid identical to that reported in the literature.2

A mixture of the nitrone 6 (72 mg, 0.35 mmol) and BCP 2 (0.03 mL, 0.29 mmol) in xylenes (2.2 mL) was heated in a screw-cap sealed Sovirel tube at 125 °C for 64 h. The reaction mixture was filtered through a short pad of silica gel eluting first with petroleum ether to remove the solvent and then with MeOH. Chromatography on silica gel (eluent: EtOAc/MeOH 3:1) of the crude mixture afforded 8$^3$ (60 mg, 72%) as a pale yellow oil [Rf 0.35 (EtOAc/MeOH 3:1)] and 9 as a beige solid (19 mg, 23%). The same procedure repeated on a larger scale (6: 750 mg, 3.62 mmol; 2: 0.2 mL, 2.18 mmol; xylenes: 16.4 mL) afforded 8 and 9 in lower yield (8: 322 mg, 51%; 9: 126 mg, 20%).

A mixture of the nitrone 10 (507 mg, 2.21 mmol) and BCP 2 (0.23 mL, 2.43 mmol) in xylenes (4 mL) in a sealed vial was irradiated in a microwave reactor first at 120 °C for 1 h and then at 125 °C for 30 min. The reaction mixture was filtered through a short pad of silica gel eluting first with petroleum ether to remove the solvent and then with MeOH. Chromatography on silica gel (eluent: EtOAc/MeOH from 20:1 to 5:1) of the concentrated methanolic solution afforded anti-12 (308 mg, 45%) as a pale yellow oil, syn-12 (69 mg, 10%) and 13 (88 mg, 13%). Compound anti-12 had the same spectral characteristics as its enantiomer,3 but had the opposite sign of optical rotation.

A suspension of methyl(triphenyl)phosphonium bromide (1.29 g, 3.6 mmol) in THF (18.4 mL) was treated with t-BuOK (387 mg, 3.45 mmol). A solution of the ketone 8 (416 mg, 1.44 mmol) in THF (16.6 mL) was then added dropwise over 20 min to the yellow suspension. The reaction mixture was stirred for 18 h at r.t., diluted with H₂O (30 mL) and the THF evaporated under reduced pressure. After extraction with Et₂O (3 x 20 mL), the combined organic layers were dried over Na₂SO₄, filtered and evaporated. The residue was purified by chromatography on silica gel (eluent: Et₂O/MeOH 4:1) to afford the VCP 14 (395 mg, 96%) as a pale yellow solid.
