## Experimental section

## General Information

All reactions were carried out in oven-dried glassware $\left(100^{\circ} \mathrm{C}\right)$ under nitrogen unless otherwise stated. Septa, disposable syringes and needles were used for the transfer of reagents and other liquid chemicals. For the drying of organic phases, water-free sodium sulfate was used.
${ }^{1} \mathrm{H}$ NMR-spectra were measured on a $400 \mathrm{MHz}(\mathrm{AVII}-400)$ or a 500 MHz (DRX-500) NMR spectrometer from Bruker. $\mathrm{CDCl}_{3}$ was used as solvent. The solvent peak was calibrated at 7.26 ppm . The analysis of the spectra was done with PC-software MestRe-C or Topspin 3.0. The abbreviations used for interpretation of NMR spectra are: $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{dd}=$ doublet of doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{m}=$ multiplet or $\mathrm{br}=$ broad. Chemical shifts were $\delta$ values and were measured in ppm.
${ }^{13} \mathrm{C}$ NMR-spectra were measured at a frequency of $100 \mathrm{MHz}(\mathrm{AVII}-400)$ or at 125 MHz (DRX-500) on NMR spectrometers from Bruker. $\mathrm{CDCl}_{3}$ was used as solvent. The solvent peak was calibrated at 77.0 ppm . The analysis of the spectra was done with PC-software MestRe-C or Topspin 3.0. Chemical shifts were $\delta$ values and were measured in ppm.

Preparative flash column chromatography was performed by using columns packed with silica gel grade $60(35-70 \mu \mathrm{~m})$ purchased from Macherey-Nagel.

Melting points were measured in open glass capillaries on apparatus MEL-TEMP II purchased from Laboratory Devices and are uncorrected.

Optical rotations were measured on a Perkin-Elmer polarimeter PE 341 at $20^{\circ} \mathrm{C}$ and $\lambda=589 \mathrm{~nm}$.

Thin-layer chromatography was done by using commercially available precoated Polygram® SIL-G/UV 254 plates purchased from Fluka. The detection of spots was done under UV-light, $\mathrm{I}_{2}$ vapours or $\mathrm{KMnO}_{4}$ solution.

Elemental analyses were performed at the Institute for Organic Chemistry, Saarland University, on the instrument Leco (model CHN900).

High-resolution mass spectrometry (HRMS) was performed at the Institute for Organic Chemistry, Saarland University, on a MAT 95Q (Finnigan). The fragmentation was carried out through chemical ionization (CI).

Solvents were dried by heating the corresponding solvent under reflux over a suitable drying agent. Tetrahydrofuran (THF) was dried over lithium aluminium hydride (LAH); dichloromethane (DCM) was dried over powdered $\mathrm{CaH}_{2}$. Commercial grade solvents such as ethyl acetate, hexane, diethyl ether were distilled prior to use.
