## Supplemental table

Table S1: Rank ordering of experimentally and computationally determined binding affinities for compounds 5, 4, 13, and 12.

| Compound | $K_{\mathrm{D}}(\mathrm{nM})$ | Docking Score <br> (Glide XP) | MM/GBSA score |
| :---: | :---: | :---: | :---: |
| $\mathbf{5}$ | $\leq 5$ | -10.8 | -84.2 |
| $\mathbf{4}$ | $\leq 5$ | -10.6 | -91.9 |
| $\mathbf{1 3}$ | $75 \pm 26$ | -11.5 | -77.9 |
| $\mathbf{1 2}$ | $615 \pm 264$ | -9.71 | -63.9 |

## Supplemental figures

Figure S1: GC-MS spectra showing sterol composition of intra-cellular T. cruzi parasites treated with indicated test compounds. The analysis of 3-8 was performed concurrently with
other CYP51 inhibitors described recently [1] and, thus, the spectra for the controls shown above are reproduced from the earlier report. Peaks are assigned as a - cholesta-7,24-dien-3 $\beta$ ol, $[\mathrm{M}]^{++}=m / z 454 ; \mathbf{b}$ - cholesta-8,24-dien-3 $\beta$-ol (zymosterol), $[\mathrm{M}]^{++}=m / z 470 ; \mathbf{c}$ - 24-methyl-7-en-cholesta-en-3 $\beta$-ol, $[\mathrm{M}]^{++}=m / z 472 ; \mathbf{d}$ - ergosta-7,24-diene-3 $\beta$-ol (episterol), $[\mathrm{M}]^{++}=m / z 470$; $\mathbf{e}$ - ergosta-8,24-diene-3 3 -ol (fecosterol), $[\mathrm{M}]^{++}=m / z 470 ; \mathbf{f}$ - lanosterol, $[\mathrm{M}]^{++}=\mathrm{m} / \mathrm{z} 498 ; \mathbf{g}$-4methylepisterol, $[\mathrm{M}]^{++}=m / z 484 ; \mathbf{h}-$ eburicol, $[\mathrm{M}]^{++}=m / z 512 ; \mathbf{i}-24$-ethyl-7,24(24')-en-cholesta-dien-3 $\beta-\mathrm{ol},[\mathrm{M}]^{+}=m / z 484$.

Figure S2: Time-course of reaction between compounds $\mathbf{1}$ or $\mathbf{6}$ with 10 mM glutathione in vitro.

## Supplemental schemes

Scheme S1: Synthesis of compound 4. Conditions: (a) HATU, DIEA, DMF; (b) HCI, dioxane; (c) Pyridyl acid, HATU, DIEA, DMF.

Scheme S2: Synthesis of activity-based probe 9. Conditions: (a) triphosgene, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, aq. $\mathrm{NaHCO}_{3}$, then N -propargylpiperazine; (b) $\mathrm{NaOH}, \mathrm{MeOH}$; (c) 15, HATU, DMF, $11 \%$ overall.

Scheme S3: Synthesis of cleavable biotin azide reagent 11. Conditions: (a) di-tert-butyl dicarbonate, $\mathrm{H}_{2} \mathrm{O}, \mathrm{NaOH}, 88 \%$; (b) $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{Et}_{3} \mathrm{~N}$; (c) $\mathrm{NaN}_{3}$, DMF, 49\% over two steps; (d) TFA, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$; (e) DMF, $\mathrm{Et}_{3} \mathrm{~N}, 59 \%$ over two steps.

Scheme S4: Synthesis of analogues 12 and 13. Conditions: (a) $\mathrm{SOCl}_{2}, \mathrm{MeOH}$; (b) isonicotinic acid, HATU, DIEA, DMF; (c) LiOH, THF, water; (d) R-NH2, HATU, DIEA, DMF.

## Experimental procedures

## Computational modeling

The binding of compounds $\mathbf{4}, \mathbf{5}, \mathbf{1 2}$, and 13 to CYP51 was modeled by using the induced fit docking software (Schrödinger Inc.). As previously described [2], these compounds were docked to a structural model that was developed based on a crystal structure of TcCYP51 (PDB code 2WUZ) [3]. In brief, the protein and the compounds were first prepared for docking by using the Protein Preparation Wizard and the Ligprep modules, respectively. The $\mathrm{Fe}^{3+}$ ion of the heme group was defined as a metal site during the docking calculations. The induced fit docking protocol was employed to address protein flexibility through the following procedures [4]. Binding models were first generated by rigid docking with a softened potential using the GLIDE standard precision (SP) scoring function [5]. Models with top docking scores were then subjected to binding-site optimization in which amino acid residues within $5 \AA$ from the docked compound were energetically minimized in the presence of the ligand by using PRIME [6]. The resulting low-energy complex structures that were within $30 \mathrm{kcal} / \mathrm{mol}$ from the lowest-energy complex were used in the subsequent redocking calculations. Each compound was redocked to these "induced fit" protein models and was evaluated by using the GLIDE extra precision (XP) scoring function. Finally, the predicted binding mode with the most favorable docking score was further refined by using the PRIME MM-GBSA protocol by energy minimizing the ligand and the surrounding protein residues within 5 Å [7].

## TcCYP51 Binding assay

All $K_{D}$ values were determined by using the UV-vis binding assay described previously [1]. Although CYP51 concentrations of $0.5 \mu \mathrm{M}$ are required in this assay, application of the Morrison equation [8] allows us to estimate ligand binding with a lower limit of $K_{\mathrm{D}} \sim 5 \mathrm{nM}$.

## CYP Inhibition and reversibility studies

Mammalian CYP inhibition values and reversibility studies were conducted by WuXi AppTech (Tianjin, China 300457) according to standard protocols.

## Cruzain kinetics

Cruzain ( 0.1 nM ) in assay buffer ( 100 mM sodium acetate pH 5.5 , 5 mM DTT, 10 mM EDTA, and $0.01 \%$ Triton-X 100) was added to inhibitor dilutions in equal volume of $1 \mu \mathrm{M}$ Z-Phe-Arg-AMC (Bachem) in the same buffer. Total assay volume is $20 \mu \mathrm{~L}$ in 384-well plate format or $200 \mu \mathrm{~L}$ in 96-well plate format. Progress curves were determined by using a Flexstation 3 fluorescent plate reader (Molecular Devices) with an excitation wavelength of 355 nm and an emission wavelength of 460 nm for 360 seconds at room temperature; for inhibitor concentrations ranging from $25-0.001 \mu \mathrm{M}$. Inhibitor dilutions that produced exponential progress curves over a wide range of $k_{\text {obs }}$ were used to determine kinetic parameters. Using Prism5 software (GraphPad), the value of $k_{\text {obs }}$, the rate constant for loss of enzymatic activity, was determined from an equation for pseudo-first-order dynamics $\left(\mathrm{P}=\left(v_{i} / k_{\mathrm{obs}}\right)\left[1-\exp \left(-k_{\mathrm{obs}}{ }^{*} t\right)\right]\right)$; where product formation $=P$, initial rate $=v_{\mathrm{i}}$, time $=t$, and the first-order rate constant $=k_{\text {obs }}$ ). For inhibitors where $k_{\text {obs }}$ varied hyperbolically with [I], nonlinear regression analysis was performed with Prism5 to determine $k_{\text {inact }} / K_{\mathrm{i}}$ using $k_{\mathrm{obs}}=k_{\text {inact }}[I] /\left([I]+K_{\mathrm{i}^{*}}\left(1+[\mathrm{S}] / K_{\mathrm{m}}\right)\right)$. $\mathrm{IC}_{50}$ values were determined by using a sigmoidal dose-response variable-slope model.

## Minimum trypanocidal concentration assay

The minimal trypanocidal concentration assay was derived from the established protocol [9] for evaluating "cidal" activity, except that each compound was evaluated at multiple concentrations (typically 7 or 10) ranging from 0 to $50 \mu \mathrm{M}$. As in the original protocol, T. cruzi infected J744 macrophages were treated with test compound for 27 days (or until T. cruzi parasites appear).

During the course of treatment, media containing the test compound was replaced every 72 hours. After 27 days of treatment, the cultures are maintained under drug-free conditions until day 40. The MTC was taken as the lowest concentration of test compound that prevents reappearance of $T$. cruzi parasites as read at day 40.

## Imaging-based screening assay

Antiparasitic $\mathrm{EC}_{90}$ values were determined by using an adaption [1] of the high-content screening approach described previously [10]. The assay employed mouse C2C12 myoblasts (ATCC\#CRL-1772) infected with T. cruzi CAI-72 [11] trypomastigotes.

## Ergosterol biosynthesis - GC-MS methods

To grow intracellular amastigotes for lipid analysis, C2C12 mouse skeletal myoblasts (4 $\times 10^{6}$ cells) cultured in $150 \mathrm{~cm}^{2}$ flasks as described elsewhere [1] were infected with $80 \times 10^{6}$ trypomastigotes for 24 hours. The cultures were treated with test compounds 72 hours postinfection at concentrations $\sim 2-4$-fold below their MTC, so as to retain a viable parasite population for analysis. Posaconazole at 100 nM was used as a positive control. The cysteine protease cruzain inhibitor K 777 [12] at $1.6 \mu \mathrm{M}$ was used as a negative control to ensure that $T$. cruzi inhibition via other pathways did not affect composition of the membrane sterols. Cells were harvested 96 hours post-infection and after 24 hours of drug treatment.

Gas chromatography/mass spectrometry (GC-MS) was used for lipid analysis as described previously [1]. Our GC-MS-based assays measure total sterol abundances, and allow us to delineate the effects of individual compounds on the ergosterol biosynthesis pathway of $T$. cruzi. Total lipids were extracted by treating the dry cell pellets with 2 mL chloroform for 24 hours. Polar lipids were removed by washing the organic phase thrice with 3 mL water. The organic phase was retained and subsequently dried on an evaporator under a stream of nitrogen gas.

The sterol-containing residue was resuspended in 2 mL of chloroform-methanol (9:1 ratio), washed thrice with 3 mL water, dried under $\mathrm{N}_{2}$ gas and resuspended in acetonitrile. The acetonitrile phase was dried under a stream of $\mathrm{N}_{2}$ and then washed with three portions of water $(3 \times 3 \mathrm{~mL})$. The extracted sterols were dissolved in hexane ( $50 \mu \mathrm{~L}$ ) and derivatized with $75 \mu \mathrm{~L}$ $N, N$-bis(trimethylsilyl)-2,2,2-trifluoroacetamide (BSTFA) (Pierce) by incubating at $37{ }^{\circ} \mathrm{C}$ for 2 h . Sterols were analyzed by GC-MS as the respective trimethylsilyl (TMS) derivatives using an Agilent HP 6850 GC system coupled with an Agilent 5979 mass-selective detector (MSD) operating at 70 eV . The individual sterols were separated using a DB-5-MS column ( $30 \mathrm{~m} \times$ 0.25 mm inner diameter, $0.25-\mathrm{m}$ film thickness) in which the temperature was held at $200^{\circ} \mathrm{C}$ for 1 min , followed by an increase of $15^{\circ} \mathrm{C} / \mathrm{min}$ up to $300^{\circ} \mathrm{C}$ and finally held at $300^{\circ} \mathrm{C}$ for 20 min .

Cellular labeling assay and "click" chemistry: C2C12 cells ( $1.5 \times 10^{6}$ cells) were pre-treated with competitor compounds in culture media ( 1 mL , DMEM with $10 \%$ FBS) for 1 hour at $37^{\circ} \mathrm{C}$. Then additional competitor compound and $9(2 \mu \mathrm{M})$ were added in culture media ( 1 mL ), and the cells were incubated for an additional hour. The cells were then pelleted, washed with phosphate-buffered saline $\mathrm{pH} 7.4(2 \times 1 \mathrm{~mL})$, and lysed with $1 \%$ SDS in phosphate-buffered saline $(400 \mu \mathrm{~L})$. The denatured lysates were sonicated to reduce viscosity, centrifuged to give pellets of the insoluble material, and normalized for total protein content. The normalized lysates ( $22 \mu \mathrm{~L}, 3 \mathrm{mg} / \mathrm{mL}$ ) were mixed with TAMRA azide $10(0.5 \mu \mathrm{~L}, 5 \mathrm{mM})$, TCEP $(0.5 \mu \mathrm{~L}, 50 \mathrm{mM}, \mathrm{pH}$ $\sim 7.0$ ), TBTA ligand in 1:4 DMSO/t-butyl alcohol ( $1.5 \mu \mathrm{~L}, 1 \mathrm{mM}$ ), and $\mathrm{CuSO}_{4}(0.5 \mu \mathrm{~L}, 50 \mathrm{mM})$. Reactions were incubated at room temperature for one hour and then resolved by SDS-PAGE. The resulting gel was scanned for fluorescence (Typhoon Imaging System, Molecular Dynamics) and coomassie stained.

Enrichment of 9 -labeled proteins and mass spectrometric analysis. C2C12 cells were treated with probe 9, lysed and denatured as described above. The labeled and denatured
lysates were sonicated to reduce viscosity and centrifuged to give pellets of the insoluble material. The buffer was then exchanged by using a NAP-5 column (GE Healthcare) equilibrated with 1\% SDS in phosphate buffered saline pH 7.4. The samples were then normalized for protein content. The normalized lysates ( $1 \mathrm{~mL}, 2 \mathrm{mg} / \mathrm{mL}$ ) were subjected to a "click" reaction with a cleaveable biotin azide 11 using the general conditions described above. Samples were enriched using Streptavidin-coupled Dynabeads (Invitrogen). Enriched proteins were eluted with aqueous sodium hydroxide ( 0.4 N ). The solution was neutralized with aqueous hydrochloric acid ( 0.8 N ), and then run on an SDS-PAGE gel. The gel was colloidal coomassie stained.

The competed band at $\sim 35 \mathrm{kDa}$ was cut, and the proteins contained in the bands of interest were digested in gel with trypsin as described previously [13]. Using the protocol we described recently [14], the extracted digests were vacuum-evaporated and resuspended in $10 \mu \mathrm{~L}$ of $0.1 \%$ formic acid in water. The digests were separated by nanoflow liquid chromatography using a 75 $\mu \mathrm{m} \times 150 \mathrm{~mm}$ reverse-phase $1.7 \mu \mathrm{~m}$ BEH 130 C 18 column (Waters) at a flow rate of $350 \mathrm{~nL} / \mathrm{min}$ in a NanoAcquity ${ }^{\top M}$ Ultra performance UPLC system (Waters). Solvent A was $0.1 \%$ formic acid in water and solvent $B$ was $0.1 \%$ formic acid in acetonitrile. Following equilibration of the column in $5 \%$ solvent $B$, approximately one-half of each digest ( $5 \mu \mathrm{~L}$ ) was injected, then the organic content of the mobile phase was increased linearly to $40 \%$ over 60 min, and then to $50 \%$ in 1 $\min$. The liquid chromatography eluate was coupled to a hybrid linear ion trap-Orbitrap mass spectrometer (LTQ-XL, Thermo Scientific, San Jose, CA) equipped with a nanoelectrospray ion source. Spraying was from an uncoated $15 \mu \mathrm{~m}$ inner diameter spraying needle (New Objective, Woburn, MA). Peptides were analyzed in positive ion mode and in information-dependent acquisition mode to automatically switch between MS and MS/MS acquisition. MS spectra were acquired in profile mode using the Orbitrap analyzer in the $\mathrm{m} / \mathrm{z}$ range between 300 and 1800 . For each MS spectrum, the 6 most intense multiple charged ions over a threshold of 1000
counts were selected to perform CID (collision-induced dissociation) experiments. Product ions were analyzed on the linear ion trap in centroid mode. The CID collision energy was automatically set to $25 \%$. A dynamic exclusion window of 0.5 Da was applied that prevented the same $m / z$ from being selected for 60 seconds after its acquisition.

Mass spectrometry data analysis. Peak lists were generated using PAVA [15]. The peak lists were searched against the murine and human subset of the UniProtKB database as of July 6, 2011 (containing 182779 entries) using ProteinProspector version 5.8.0. Peptide tolerance in searches was 20 ppm for precursor and 0.6 Da for product ions, respectively. Cleavage specificity was selected to Trypsin. Peptides containing two miscleavages were allowed. Carbamidomethylation of cysteine, acetylation of the N -terminus of the protein, pyroglutamate formation from N -terminal glutamine, and oxidation of methionine were allowed as variable modifications.

The number of modifications was limited to two per peptide. Hits were considered significant when two or more peptide sequences matched a protein entry and the Prospector score was above the significance level. A minimal ProteinProspector protein score of 20, a peptide score of 15 , a maximum expectation value of 0.05 and a minimal discriminate score threshold of 0.0 were used for initial identification criteria. For identifications based on one peptide sequence with high scores, the MS/MS spectrum was reinterpreted manually by matching all the observed fragment ions to a theoretical fragmentation obtained by using MS Product (Protein Prospector).

## Reactivity with glutathione

Compounds 1 and 6 were incubated with reduced glutathione (10mM) in phosphate-buffered saline ( pH 7.4 ). The reactions were quenched with a solution of trifluoroacetic acid (2\%) in methanol and then separated by reverse-phase liquid chromatography. The amount of
unreacted compound remaining was quantified by integrating the compound peak observed by evaporative light scattering. This value was normalized to an internal control of quinine, and then used to report the fraction of compound remaining.

## Synthetic procedures.

${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Varian INOVA-400 400 MHz spectrometer. Chemical shifts are reported in $\delta$ units ( ppm ) relative to residual solvent peaks. Coupling constants ( $\mathcal{J}$ ) are reported in hertz $(\mathrm{Hz})$. Compounds 1, 2, and 3 were prepared as described previously [16] and TAMRA azide 10 was prepared according to the reported procedure [17]. Compound 9 was prepared as described below and exhibited spectral characteristics consistent with those reported previously [18]. Intermediate 15 was prepared as described previously [19]. All reagents and solvents were purchased from Aldrich Chemical or Acros Organics and used as received. Column chromatography was carried out by using a Biotage SP1 flashchromatography system and silica-gel cartridges from Biotage. Analytical TLC plates from EM Science (Silica Gel 60 F254) were employed for TLC analyses. Preparative HPLC purifications were performed by using a Biotage Parallex Flex equipped with Waters Xbridge $19 \times 50 \mathrm{~mm}$ C18 $5 \mu \mathrm{M}$ OBD columns.

## tert-Butyl $\quad N-[(2 S)-1-[[(E, 3 S)$-1-(benzenesulfonyl)-5-phenylpent-1-en-3-yl]amino]-3-(4-methylphenyl)-1-oxopropan-2-yl]carbamate (16).

(2S)-3-(4-Methylphenyl)-2-[(2-methylpropan-2-yl)oxycarbonylamino]propanoic acid (14, 0.040 g , 0.143 mmol ) and ( $1 E, 3 S$ )-1-(benzenesulfonyl)-5-phenylpent-1-en-3-amine hydrochloride (15, $0.051 \mathrm{~g}, 0.150 \mathrm{mmol})$ were dissolved in 1 mL DMF. HATU ( $0.086 \mathrm{~g}, 0.225 \mathrm{mmol}$ ) was added, followed by diisopropylethylamine ( $0.150 \mathrm{~mL}, 0.858 \mathrm{mmol})$. The reaction mixture was stirred at room temperature until complete as judged by LC-MS. The reaction mixture was diluted with 5
mL ethyl acetate, shaken with $5 \mathrm{~mL} 1 \mathrm{~N} \mathrm{HCl}, 5 \mathrm{~mL} 50 \%$ saturated $\mathrm{NaHCO}_{3}$ then 5 mL brine. The organic layer was further dried with $\mathrm{MgSO}_{4}$. Solvent was removed to afford the crude product $(89 \mathrm{mg})$, which was used without further purification. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 1.26-1.54(\mathrm{~m}$, 9 H), 1.74-1.96 (m, 2 H), 2.28 (s, $3 H$ H), 2.49-2.64 (m, 2 H), 2.91-3.01 (m, 2 H), 4.18- 4.28 (m, 1 H), 4.59-4.71 (m, 1 H), 4.97 (br s, $1 H$ ), $6.11-6.22(\mathrm{~m}, 2 \mathrm{H}), 6.79(\mathrm{dd}, J=15.11,4.67 \mathrm{~Hz}, 1 \mathrm{H})$, 6.98-7.11 (m, 5 H), 7.14-7.20 (m, 1 H), 7.19-7.25 (m, 1 H), 7.48-7.54 (m, 2 H), 7.57-7.66 (m, $1 \mathrm{H}), 7.81-7.85(\mathrm{~m}, 1 \mathrm{H})$.

## General procedure for preparing pyridyl analogs 3 and 4.

tert-Butyl $\quad N-[(2 S)-1-[[(E, 3 S)$-1-(benzenesulfonyl)-5-phenylpent-1-en-3-yl]amino]-3-(4-methylphenyl)-1-oxopropan-2-yl]carbamate (16) is treated with 4 N HCl in dioxane ( $\sim 100$ molar equiv HCl ) at room temperature until cleavage if the Boc group is complete, as judged by LC/MS analysis. The solvent is then removed and the residue resuspended in DMF ( $\sim 0.15 \mathrm{M}$ ). The requisite pyridine carboxylic acid (1.2 equiv), HATU (1.5 equiv) and diisopropylethylamine (6.0 equiv) are added and the reaction mixture stirred until the coupling is judged complete by LC/MS analysis, typically 12 hours. The reaction mixture is then diluted with ethyl acetate (at least $5 x$ volume) and shaken with an equivalent volume of $50 \%$ saturated aqueous $\mathrm{NaHCO}_{3}$. The organic layer is separated and then washed with saturated NaCl , and dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated to afford the crude product, which is purified using automated silica gel chromatography with a mobile phase of ethyl acetate/hexanes.

## $N-[(2 S)-1-[[(E, 3 S)-1-(B e n z e n e s u l f o n y l)-5-p h e n y l p e n t-1-e n-3-y l] a m i n o]-3-(4-m e t h y l p h e n y l)-$ 1-oxopropan-2-yl]pyridine-2-carboxamide trifluoroacetate salt (3).

Compound 3 was prepared according to the general procedure except that additional purification by HPLC was required. $10 \%$ overall yield from $14{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$
$1.71-1.82(\mathrm{~m}, 1 \mathrm{H}), 1.82-1.92(\mathrm{~m}, 1 \mathrm{H}), 2.29(\mathrm{~s}, 3 \mathrm{H}), 2.48-2.57(\mathrm{~m}, 2 \mathrm{H}), 3.16(\mathrm{dd}, \mathrm{J}=7.05$, $2.11 \mathrm{~Hz}, 2 \mathrm{H}), 4.65(\mathrm{dd}, J=5.13,3.48 \mathrm{~Hz}, 1 \mathrm{H}), 4.75(\mathrm{q}, J=7.33 \mathrm{~Hz}, 1 \mathrm{H}), 6.22(\mathrm{dd}, J=15.11$, $1.74 \mathrm{~Hz}, 1 \mathrm{H}), 6.39(\mathrm{~d}, J=7.87 \mathrm{~Hz}, 1 \mathrm{H}), 6.80(\mathrm{dd}, J=15.11,4.85 \mathrm{~Hz}, 1 \mathrm{H}), 6.96-7.02(\mathrm{~m}, 2 \mathrm{H})$, 7.02-7.09 (m, 2 H), 7.09-7.22 (m, $4 H$ ), 7.48 (ddd, $J=7.55,4.81,1.01 \mathrm{~Hz}, 1 \mathrm{H}$ ), 7.52-7.60 (m, $2 H), 7.60-7.67(\mathrm{~m}, 1 \mathrm{H}), 7.82-7.92(\mathrm{~m}, 2 \mathrm{H}), 8.14(\mathrm{~d}, J=7.87 \mathrm{~Hz}, 1 \mathrm{H}), 8.53-8.66(\mathrm{~m}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (100 MHz, $\mathrm{CDCl}_{3}$ ) $\delta 21.1,31.7,35.5,37.3,49.3,55.3,122.7,126.2,126.8,127.6,128.3$, $128.5,129.1,129.3,129.5,130.6,133.2,133.4,136.9,138.0,140.2,140.3,145.5,147.9,148.6$, 164.3, 170.4; $\mathrm{MS}:(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}=568.6$

## $N-[(2 S)-1-[[(E, 3 S)$-1-(Benzenesulfonyl)-5-phenylpent-1-en-3-yl]amino]-3-(4-methylphenyl)-1-oxopropan-2-yl]pyridine-4-carboxamide (4).

Compound 4 was prepared according to the general procedure in $45 \%$ overall yield from $14 .{ }^{1} \mathrm{H}$ NMR (400 MHz, CDCl ${ }_{3}$ ) $81.71-1.84(\mathrm{~m}, 1 \mathrm{H}), 1.84-1.97(\mathrm{~m}, 1 \mathrm{H}), 2.23(\mathrm{~s}, 1 \mathrm{H}), 2.34(\mathrm{~s}, 2 \mathrm{H})$, 2.46-2.64 (m, 2 H), 2.77-2.86 (m, 1 H), 3.01 (dd, $J=13.46,8.88 \mathrm{~Hz}, 1 \mathrm{H}$ ), 3.17 (dd, J=13.92, $5.86 \mathrm{~Hz}, 1 \mathrm{H}), 4.59-4.73(\mathrm{~m}, 1 \mathrm{H}), 5.75(\mathrm{~d}, J=8.24 \mathrm{~Hz}, 1 \mathrm{H}), 6.19(\mathrm{~d}, J=1.65 \mathrm{~Hz}, 1 \mathrm{H}), 6.15(\mathrm{~d}$, $J=1.47 \mathrm{~Hz}, 1 \mathrm{H}), 6.77(\mathrm{~d}, J=5.49 \mathrm{~Hz}, 1 \mathrm{H}), 6.73(\mathrm{~d}, J=5.31 \mathrm{~Hz}, 1 \mathrm{H}), 6.87(\mathrm{~d}, J=7.33 \mathrm{~Hz}, 1$ H), 6.99-7.29 (m, 7 H), 7.43-7.72 (m, 3 H), 7.72-8.00 (m, $2 H$ ), 8.62-8.84 (m, 2 H ); MS: ( $\mathrm{m} / \mathrm{z}$ ): $[\mathrm{M}+\mathrm{H}]^{+}=568.6$

## General procedure for reduction of 1,3 and 4 to afford analogs 6, 7 and 8.

The vinylsulfone starting material was dissolved in ethanol ( 0.015 mM concentration) and one weight equivalent of $10 \%$ Pd on C was added. The flask was evacuated and filled with hydrogen three times, and the reaction mixture was maintained under a hydrogen atmosphere ( 1 atm ) until the vinyl group was fully reduced, but before over-reduction of the pyridyl ring began to occur. Typically this required $\sim 6 \mathrm{~h}$. The hydrogen balloon was then removed and the reaction
mixture filtered through Celite. The filtrate was concentrated and the crude product purified by using automated silica-gel chromatography with a mobile phase of ethyl acetate/hexanes.

## Benzyl (2S)-3-phenyl-2-[(4-(prop-2-ynyl)piperazine-1-carbonyl)amino]propanoate (18).

Benzyl (2S)-2-amino-3-phenylpropanoate hydrochloride (17, $2.0 \mathrm{~g}, 6.85 \mathrm{mmol}, 1.0$ equiv) was dissolved in methylene chloride ( 70 mL ), and the solution was cooled in an ice/water bath. A saturated aqueous solution of sodium bicarbonate ( 70 mL ) was then added, followed by a solution of triphosgene ( $0.81 \mathrm{~g}, 2.74 \mathrm{mmol}, 0.4$ equiv) in methylene chloride ( 15 mL ), which was added slowly. The reaction was stirred for 1 hour and then quenched by the addition of excess benzylamine. The aqueous layer was extracted with methylene chloride ( $2 \times 50 \mathrm{~mL}$ ) and the combined organic layers were then washed with 1 M hydrochloric acid $(2 \times 10 \mathrm{~mL})$. Hexane was added to precipitate the desired isocyanate intermediate ( $1.7 \mathrm{~g}, 89 \%$ crude yield) which contained a small amount of starting material. A portion of this material was used without further purification in the next reaction.

A flask was charged with 4-(prop-2-ynyl)piperazine dihydrochloride ( $120 \mathrm{mg}, 0.61 \mathrm{mmol}, 1.0$ equiv) and dissolved in a mixture of tetrahydrofuran ( 1 mL ), dimethylformamide ( 0.4 mL ), and diisopropylethylamine ( $0.42 \mathrm{~mL}, 2.44 \mathrm{mmol}, 4.0$ equiv). In another flask, the crude benzyl (2S)-

2-isocyanato-3-phenylpropanoate ( $171 \mathrm{mg}, 0.061 \mathrm{mmol}, 1.0$ equiv) was dissolved in tetrahydrofuran (1 mL) and chilled in an ice/water bath. The 4-(prop-2-ynyl)piperazine solution was then added dropwise to the solution of isocyanate. After 1 hour, the reaction was diluted with ethyl acetate ( 10 mL ) and washed with water ( $5 \times 5 \mathrm{~mL}$ ) and brine ( 5 mL ). The organic layer was then dried over sodium sulfate, filtered, and concentrated. The crude residue was subjected to automated flash chromatography using a solvent gradient of methanol in dichloromethane ( $0-4 \%$ ). The relevant fractions were collected and concentrated to afford benzyl (2S)-3-phenyl-2-[(4-(prop-2-ynyl)piperazine-1-carbonyl)amino]propanoate (18, 195 mg , $79 \%$ yield, $\sim 85 \%$ pure) as a clear gum. This material was used in the next step without further purification. MS : $406.15[\mathrm{M}+\mathrm{H}]$.

## $N$-[(2S)-1-[[(E,3S)-1-(Benzenesulfonyl)-5-phenylpent-1-en-3-yl]amino]-1-oxo-3-phenylpropan-2-yl]-4-prop-2-ynylpiperazine-1-carboxamide (9).

A flask was charged with benzyl (2S)-3-phenyl-2-[(4-(prop-2-ynyl)piperazine-1carbonyl)amino]propanoate ( $18,90 \mathrm{mg}, 0.22 \mathrm{mmol}, 1.0$ equiv), and methanol ( 2 mL ) was added. Aqueous sodium hydroxide ( $2 \mathrm{M}, 0.24 \mathrm{~mL}$ ) was added, and the resulting mixture was stirred overnight and then concentrated to dryness. The resulting crude (2S)-3-phenyl-2-[(4-(prop-2-ynyl)piperazine-1-carbonyl)amino]propanoic acid (MS: $316.04(\mathrm{M}+\mathrm{H})$ ) was dissolved in dimethylformamide ( 1 mL ) and treated with ( $E, 3 S$ )-1-(benzenesulfonyl)-5-phenylpent-1-en-3amine ( $75 \mathrm{mg}, 0.22 \mathrm{mmol}, 1.0$ equiv) and diisopropylethylamine ( $118 \mu \mathrm{~L}, 0.67 \mathrm{mmol}, 3.0$ equiv). The mixture was then cooled in a dry ice-acetone bath, and HATU $(92.8 \mathrm{mg}, 0.24 \mathrm{mmol}, 1.1$ equiv) was added in one portion. The reaction was allowed to slowly warm to $-40^{\circ} \mathrm{C}$ over 3 hours and was then diluted in ethyl acetate ( 20 mL ) and washed with water ( $5 \times 5 \mathrm{~mL}$ ) and brine ( 5 mL ). The organic layer was dried over sodium sulfate, filtered and concentrated. The crude material was then purified by reverse-phase HPLC, affording 17 mg of compound 2 as a white
solid (11\% over three steps). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 1.79(\mathrm{~m}, 1 \mathrm{H}), 1.89(\mathrm{~m}, 1 \mathrm{H}), 2.50(\mathrm{t}, \mathrm{J}$ $=2.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.52-2.62(\mathrm{~m}, 2 \mathrm{H}), 2.92-3.07(\mathrm{~m}, 6 \mathrm{H}), 3.60(\mathrm{~m}, 4 \mathrm{H}), 3.72(\mathrm{~m}, 2 \mathrm{H}), 4.37(\mathrm{q}, \mathrm{J}=$ $7.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.61(\mathrm{~m}, 1 \mathrm{H}), 5.12(\mathrm{~m}, 1 \mathrm{H}), 5.98(\mathrm{~m}, 1 \mathrm{H}), 6.07(\mathrm{dd}, J=15.4,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.75(\mathrm{dd}, J$ $=15.4,5.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.00-7.90(\mathrm{~m}, 15 \mathrm{H})$. LCMS: 599.17 (M+H); MW: 598.75).
tert-Butyl 5-hydroxypentylcarbamate (20): 5-Amino-1-pentanol (19, $500 \mathrm{mg}, 4.85 \mathrm{mmol}$ ) and di-tert-butyl dicarbonate ( $881 \mathrm{mg}, 4.04 \mathrm{mmol}$ ) were dissolved in water $(5 \mathrm{~mL})$. The solution was adjusted to pH 12 with $1 \mathrm{~N} \mathrm{NaOH}(\mathrm{aq})$ and stirred for 20 min . The reaction was extracted three times with ethyl acetate. The organic layers were combined, washed with brine, dried over sodium sulfate, and concentrated to afford the product as a clear oil ( $719 \mathrm{mg}, 88 \%$ yield). ${ }^{1} \mathrm{H}$ NMR (400 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta 1.30-1.70(\mathrm{~m}, 15 \mathrm{H}), 3.12(\mathrm{q}, J=6.5 \mathrm{~Hz}, 2 \mathrm{H}), 3.63(\mathrm{~m}, 2 \mathrm{H}), 4.53(\mathrm{~b} \mathrm{~s}$, 1H).

5-(tert-Butoxycarbonylamino)pentyl 6-bromohexanoate (22): tert-Butyl 5hydroxypentylcarbamate ( $\mathbf{2 0}, 696 \mathrm{mg}, 3.42 \mathrm{mmol}$ ) and triethylamine ( $416 \mathrm{mg}, 4.11 \mathrm{mmol}$ ) were mixed in methylene chloride ( 5 mL ) and cooled in an ice-water bath. The 6-bromohexanoyl chloride (21, $1.464 \mathrm{~g}, 6.06 \mathrm{mmol})$ in methylene chloride ( 5 mL ) was added slowly to the reaction. After 20 min , water ( 5 mL ) was added, and the aqueous layer was acidified with 1 N $\mathrm{HCl}(\mathrm{aq})$. The organic layer was separated, washed with saturated $\mathrm{NaHCO}_{3}(\mathrm{aq})$ and brine, dried over sodium sulfate, and concentrated under reduced pressure. A clear oil containing a mixture (2:1) of the desired product and the starting acid chloride was obtained after silica flash chromatography using a gradient of ethyl acetate up to $25 \%(\mathrm{v} / \mathrm{v})$ in hexanes. The crude material was used without further purification. ${ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 1.30-1.55(\mathrm{~m}, 15 \mathrm{H})$, $1.59-1.69(\mathrm{~m}, 4 \mathrm{H}), 1.82-1.92(\mathrm{~m}, 2 \mathrm{H}), 2.31(\mathrm{t}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 3.11(\mathrm{q}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 3.40(\mathrm{t}, J$ $=6.8 \mathrm{~Hz}, 2 \mathrm{H}), 4.05(\mathrm{t}, J=6.7 \mathrm{~Hz}, 2 \mathrm{H}), 4.51(\mathrm{br} \mathrm{s}, 1 \mathrm{H})$.

5-(tert-Butoxycarbonylamino)pentyl 6-azidohexanoate (23): Crude 5-(tertbutoxycarbonylamino) pentyl 6-bromohexanoate (22, 220 mg ) and sodium azide ( $301 \mathrm{mg}, 4.63$ $\mathrm{mmol})$ were dissolved in dimethylformamide $(10 \mathrm{~mL})$. The vented mixture was stirred at $50^{\circ} \mathrm{C}$ behind a blast shield for 48 h . The reaction was diluted in ethyl acetate ( 80 mL ) and washed extensively with water. The organic layer was washed with brine, dried over sodium sulfate, and concentrated. Silica flash chromatography using a gradient of ethyl acetate up to $25 \%(v / v)$ in hexanes yielded the desired product as a yellow oil, ( $110 \mathrm{mg}, 49 \%$ yield over 2 steps). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 1.30-1.55(\mathrm{~m}, 15 \mathrm{H}), 1.55-1.70(\mathrm{~m}, 6 \mathrm{H}), 2.30(\mathrm{t}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 3.10(\mathrm{q}, J$ $=6.5 \mathrm{~Hz}, 2 \mathrm{H}), 3.26(\mathrm{t}, J=6.9 \mathrm{~Hz}, 2 \mathrm{H}), 4.05(\mathrm{t}, J=6.7 \mathrm{~Hz}, 2 \mathrm{H}), 4.50(\mathrm{br} . \mathrm{s}, 1 \mathrm{H})$.

5-Aminopentyl 6-azidohexanoate (24): 5-(tert-Butoxycarbonylamino)pentyl 6-azidohexanoate $(23,50 \mathrm{mg}, 0.146 \mathrm{mmol})$ was dissolved in methylene chloride $(0.6 \mathrm{~mL})$ and cooled in an ice bath. Trifluoroacetic acid $(0.4 \mathrm{~mL})$ was added dropwise and then stirred for 20 min . Volatiles were removed under reduced pressure to afford the trifluoroacetic acid salt in quantitative yield as a yellow oil. ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ : $1.34-1.47(\mathrm{~m}, 4 \mathrm{H}), 1.55-1.75(\mathrm{~m}, 8 \mathrm{H}), 2.31(\mathrm{t}, \mathrm{J}=$ $7.5 \mathrm{~Hz}, 2 \mathrm{H}), 2.96(\mathrm{~m}, 2 \mathrm{H}), 3.26(\mathrm{t}, J=6.9 \mathrm{~Hz}, 2 \mathrm{H}), 4.05(\mathrm{t}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 7.80(\mathrm{~m}, 3 \mathrm{H})$.

Base cleavable biotin azide (11): 5-aminopentyl 6-azidohexanoate (24, TFA salt, 31.3 mg , $0.088 \mathrm{mmol})$, biotin-NHS ester ( $25,20 \mathrm{mg}, 0.059 \mathrm{mmol})$, triethylamine ( $17.8 \mathrm{mg}, 0.175 \mathrm{mmol}$ ) were dissolved in dimethylformamide ( 0.8 mL ) and stirred at room temperature for 48 h . The reaction was diluted into ethyl acetate ( 20 mL ), washed three times with $0.5 \mathrm{~N} \mathrm{HCl}(\mathrm{aq})$, once with brine, dried over magnesium sulfate, and concentrated. Silica flash chromatography using stepwise $0.5 \%$ increments methanol to $10 \%(\mathrm{v} / \mathrm{v})$ in methylene chloride yielded the desired product as a white solid (16.2 mg, $59 \%$ yield). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): 1.29-1.79 (m, 16H), $2.18(\mathrm{t}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 2.30(\mathrm{t}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 2.72(\mathrm{~d}, J=12.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.89(\mathrm{dd}, J=4.8,12.7$
$\mathrm{Hz}, 1 \mathrm{H}), 3.13(\mathrm{~m}, 2 \mathrm{H}), 3.21(\mathrm{q}, J=6.5 \mathrm{~Hz}, 2 \mathrm{H}), 3.26(\mathrm{t}, J=7.4 \mathrm{~Hz}, 2 \mathrm{H}), 4.05(\mathrm{t}, J=6.7 \mathrm{~Hz}, 2 \mathrm{H})$, $4.30(\mathrm{dd}, J=7.4,4.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.50(\mathrm{dd}, J=7.4,5.0 \mathrm{~Hz}, 1 \mathrm{H}), 5.71(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 6.09(\mathrm{~m}, 1 \mathrm{H}), 6.39$ (s, 1H). ${ }^{13} \mathrm{C}$ NMR (100 MHz, $\mathrm{CDCl}_{3}$ ): 23.28, 24.49, 25.64, 26.22, 28.07, 28.23, 28.31, 28.53, $29.21,34.06,36.00,39.28,40.47,51.21,55.60,60.29,61.89,64.14,173.14,173.57$.

## Methyl (2S)-3-(4-methylphenyl)-2-(pyridine-4-carbonylamino)propanoate (27).

To a flask containing anhydrous methanol ( 5.0 mL ) and cooled in an ice bath was added thionyl chloride ( $0.71 \mathrm{~mL}, 9.77 \mathrm{mmol}, 3.5$ equiv). After stirring for 5 minutes, (2S)-2-amino-3-(4methylphenyl)propanoic acid (26, $0.50 \mathrm{~g}, 2.79 \mathrm{mmol})$ was added and the reaction mixture was warmed to room temperature with stirring for 64 hours. The solvent was evaporated and the residue was triturated twice with ether to afford methyl (2S)-2-amino-3-(4methylphenyl)propanoate hydrochloride ( $0.61 \mathrm{~g}, 95 \%$ ).
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{D}_{2} \mathrm{O}$ ) $\delta 2.31$ (s, 3 H ), 3.19 (dd, $J=14.47,7.33 \mathrm{~Hz}, 1 \mathrm{H}$ ), 3.28 (dd, $J=14.56$, $5.95 \mathrm{~Hz}, 1 \mathrm{H}), 3.82(\mathrm{~s}, 3 \mathrm{H}), 4.39(\mathrm{dd}, J=7.33,6.04 \mathrm{~Hz}, 1 \mathrm{H}), 7.11-7.21(\mathrm{~m}, 2 \mathrm{H}), 7.21-7.30(\mathrm{~m}$, 2 H).

A solution of (2S)-2-amino-3-(4-methylphenyl)propanoate hydrochloride ( $0.61 \mathrm{~g}, 2.67 \mathrm{mmol}$ ) in DMF ( 10 mL ) was treated with isonicotinic acid ( $0.39 \mathrm{~g}, 3.20 \mathrm{mmol}$ ), HATU ( $1.52 \mathrm{~g}, 4.01 \mathrm{mmol}$ ) and diisopropylethylamine $(2.32 \mathrm{~mL}, 13.4 \mathrm{mmol})$ and the reaction mixture stirred overnight. The reaction mixture was then poured into ethyl acetate and washed with $50 \%$ saturated $\mathrm{NaHCO}_{3}$, saturated NaCl , and dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated. The crude product was purified by automated silica-gel chromatography to afford 27 ( $0.36 \mathrm{~g}, 45 \%$ overall) ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 2.24-2.39(\mathrm{~m}, 3 \mathrm{H}), 3.21(\mathrm{qd}, \mathrm{J}=13.83,5.40 \mathrm{~Hz}, 2 \mathrm{H}), 3.73-3.83(\mathrm{~m}, 3 \mathrm{H}), 4.96-5.12$ ( $\mathrm{m}, 1 \mathrm{H}$ ) , 6.61 (d, $J=6.41 \mathrm{~Hz}, 1 \mathrm{H}), 6.98(\mathrm{~d}, J=7.69 \mathrm{~Hz}, 2 \mathrm{H}), 7.09(\mathrm{~d}, J=7.87 \mathrm{~Hz}, 2 \mathrm{H}), 7.49-$ 7.63 (m, 2 H), 8.65-8.80 (m, 2 H).

## General procedure for the synthesis of 12 and 13 from 27.

Intermediate 27 ( $0.36 \mathrm{~g}, 1.22 \mathrm{mmol}$ ) was dissolved in $5 \mathrm{~mL} 4: 1 \mathrm{THF} /$ water and then lithium hydroxide ( $0.117 \mathrm{~g}, 4.86 \mathrm{mmol}$ ) was added. The reaction mixture was stirred at room temperature and usually forms a suspension. When the hydrolysis reaction was judged to be complete by LC/MS, the reaction mixturewas adjusted to $\mathrm{pH} \sim 4$ by slow addition of $\sim 0.8 \mathrm{~mL} 2 \mathrm{~N}$ HCl . The solvent was then removed in vacuo, and the crude lithium carboxylate intermediate was used in subsequent coupling reactions without further purification.

A portion of the lithium carboxylate intermediate was dissolved in DMF ( 0.15 M ) and the requisite amine ( 2.2 equiv), HATU ( 2.0 equiv), and diisopropylethylamie ( 5.0 equiv) were added. The reaction mixture was stirred at room temperature until the reaction was judged complete by LC/MS (typically 2 h ). The reaction mixture was then diluted with ethyl acetate (at least 5 x volume) and shaken with an equivalent volume of $50 \%$ saturated $\mathrm{NaHCO}_{3}$. The organic layer was then separated, washed with saturated NaCl , dried $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated. The crude product was then purified by automated silica-gel chromatography (ethyl acetate/hexanes) and/or preparative HPLC to afford the final product.

## $N$-[(2S)-1-(Methylamino)-3-(4-methylphenyl)-1-oxopropan-2-yl]pyridine-4-carboxamide

 (12).Prepared according to the general procedure, employing methylamine in the coupling reaction. Yield: $33 \%{ }^{1} \mathrm{H}$ NMR (400 MHz, $\mathrm{CDCl}_{3}$ ) $\delta 2.15-2.33(\mathrm{~m}, 3 \mathrm{H}), 2.60-2.77(\mathrm{~m}, 3 \mathrm{H}), 2.97-3.12(\mathrm{~m}$, $1 \mathrm{H}), 3.12-3.24(\mathrm{~m}, 1 \mathrm{H}), 4.78(\mathrm{td}, J=7.83,6.50 \mathrm{~Hz}, 1 \mathrm{H}), 6.15(\mathrm{~d}, J=4.58 \mathrm{~Hz}, 1 \mathrm{H}), 6.93-7.17$ (m, 3 H), 7.46-7.63 (m, 3 H), 8.53-8.72 (m, 2 H$)$; MS: $(\mathrm{m} / \mathrm{z}):[\mathrm{M}+\mathrm{H}]^{+}=298.1$
