Materials and methods

All materials were used as purchased (from Acros, Alfa Aesar, Grüssing, Merck, or Sigma-Aldrich, Germany). Thin-layer chromatography was performed using TLC aluminum sheets silica gel 60 F254, or TLC aluminum sheets RP silica gel 18 F254 (Merck, Darmstadt, Germany). Colored compounds were visible at daylight; other compounds were visualized under UV light (254 nm). Flash chromatography was performed on a Büchi system using silica gel RP-18 (Merck, Darmstadt, Germany). Microwave reactions were conducted in a CEM Focused™ Microwave Synthesis type Discover apparatus. A freeze dryer (CHRIST ALPHA 1-4 LSC) was used for lyophilization. Melting points were determined using a Büchi Melting Point B-545 apparatus.

The purities of isolated products were determined by ESI–mass spectra obtained on an LCMS instrument (Applied Biosystems API 2000 LCMS/MS, HPLC Agilent 1100) using the following procedure: the compounds were dissolved at a concentration of 0.5 mg/mL in water:methanol (1:1), containing 2 mM NH₄CH₃COO. Then, 10 µL of the sample was injected into an HPLC column (Phenomenex Luna 3µ C18, 50 × 2.00 mm). Elution was performed with a gradient of water:methanol (containing 2 mM NH₄CH₃COO) from 90:10 to 0:100 starting the gradient immediately at a flow rate of 250 µL/min for 15 min followed by washing with 100 % methanol for another 15 min. UV absorption was detected from 200 to 600 nm using a diode array detector. The purity of the compounds proved to be ≥ 94%.

HRMS was recorded on a microTOF-Q mass spectrometer (Bruker) with ESI-source coupled with an HPLC Dionex Ultimate 3000 (Thermo Scientific) using an EC50/2 Nucleodur C18 Gravity 3 µm column (Macherey-Nagel). The column temperature was
25 °C. Ca. 1 μL of a 1 mg/mL solution of the sample in acetonitrile was injected and a flow rate of 0.3 mL/min was used. HPLC was started with a solution of acetonitrile in water (10:90), containing 2 mM NH₄CH₃COO. The gradient was started after 1 min reaching 100% acetonitrile within 9 min and then flushed with this concentration for another 5 min. ¹H- and ¹³C-NMR data were collected on a Bruker Avance 500 MHz NMR spectrometer at 500 MHz (¹H), and 126 MHz (¹³C), or on a 600 MHz NMR spectrometer at 600 MHz (¹H), and 151 MHz (¹³C). DMSO-d₆ or chloroform-d was used as a solvent. Chemical shifts are reported in parts per million (ppm) relative to the deuterated solvent, i.e. DMSO, δ ¹H: 2.49 ppm; ¹³C: 39.7 ppm; chloroform, δ ¹H: 7.26 ppm; ¹³C: 77.36 ppm. Coupling constants J values are given in Hertz and spin multiplicities are given as s (singlet), d (doublet), t (triplet), m (multiplet), br (broad).

Sodium dithionite (2.26 g, 13 mmol) was added under argon to a suspension of finely powdered 1-amino-9,10-dioxo-9,10-dihydroanthracene (3) (2.20 g, 10 mmol) in 75 mL of a mixture of ethanol:water:1N NaOH (5:1:1.5, v/v/v). The mixture was then heated at 60 °C until a clear light orange solution was obtained, then it was cooled down to rt followed by the addition of 37 % formaldehyde (8 mL, 100 mmol) under argon with vigorous stirring. The reaction was stopped after 40 s and a stream of air was introduced to the reaction mixture from an air-line. The resulting precipitate was collected by filtration, washed with water and dried under vacuum. Column chromatography of the crude product on silica gel using a gradient of acetone/dichloromethane from 1 % up to 5 %

**1-Amino-4-bromo-9,10-dioxo-9,10-dihydroanthracene-2-carbonitrile (9)**

**Method A.** To a 10 mL microwave vial, 1-amino-4-bromo-2-hydroxymethyl-9,10-dioxo-9,10-dihydroanthracene (6) (1.0 g, 0.3 mmol), aq. ammonium hydroxide solution (25 %, 1.35 mL, 18 mmol), iodine (0.305 g, 1.2 mmol) and THF (0.4 mL) were added. The mixture was stirred for 5 min at rt and then irradiated in the microwave oven at 90 W, 80 °C for 10 min. Additional amounts of iodine (0.165 g, 0.65 mmol) and aq. ammonium
hydroxide solution (25 %, 0.65 mL, 8.7 mmol) were added to the reaction mixture, and then irradiated in the microwave for another 10 min under the same conditions. Then, another portion of iodine (0.165 g, 0.65 mmol) and aq. ammonium hydroxide solution (25 %, 0.65 mL, 8.7 mmol) were added and the reaction mixture was irradiated for 10 more min. Then, an aq. solution of Na2S2O3 (5%, 60 mL) was added, and the organic materials were extracted with dichloromethane (3× 50 mL). The combined organic layers were washed with brine (3× 30 mL), dried over MgSO4, filtered, and the solvent evaporated under vacuum. Column chromatography of the crude product on silica gel using a gradient of dichloromethane/cyclohexane from 30% up to 60 % provided 9 (0.834 g, 85.0 %) as an orange solid. **HPLC-UV (220 – 600 nm) ESI-MS, purity: 95.0 %**.

**Method B.** A suspension of 1-amino-9,10-dioxo-9,10-dihydroanthracene-2-carbonitrile (12, 0.62 g, 2.5 mmol) in dry DMF (20 mL) was heated at 90 °C until a clear, red-colored solution was obtained. A solution of bromine (0.258 mL, 5 mmol) in dry DMF (2 mL) was dropwise added within 30 min. The reaction mixture was stirred at 90 °C for 30 min, before an additional amount of bromine (0.10 mL, 2.0 mmol) in DMF (1 mL) was added dropwise. The progress of the reaction was monitored by TLC, and the reaction was complete within 5 min. Upon cooling down to rt, the product precipitated as an orange-colored solid, then a solution of NaHSO3 (1 g) dissolved in demineralized water (10 mL) was added, and the precipitate was filtered off, washed with water and dried in an oven at 50 °C. Compound 9 (0.777 g, 95.0 %) was obtained as an orange solid. **HPLC-UV (220 – 600 nm) ESI-MS, purity: 97.0 %**;

**1-Amino-2-(1H-tetrazol-5-yl)-9,10-dioxo-9,10-dihydroanthracene (11)**

A 25 mL round bottom flask was fitted with 1-amino-9,10-dioxo-9,10-dihydroanthracene-2-carbonitrile (12) (0.248 g, 1.0 mmol), NaN$_3$ (0.325 g, 5.0 mmol) and NH$_4$Cl (0.267 g, 5.0 mmol), followed by dry DMF (5 mL) under argon. The mixture was subsequently heated to 125 °C. The color of the solution changed from orange to red wine-color and the reaction was completed after 30 min (as monitored by TLC). It was left to cool down to rt, and it was then slowly added to 30 mL of a saturated NaHCO$_3$ solution. The resulting solution was extracted with ethyl acetate (3 × 100 mL). NaNO$_2$ (0.27 g) was added to the combined aqueous layers which were then acidified cautiously with conc. HCl to pH 1. The formed precipitate was collected by filtration, washed with water, and dried in an oven at 50 °C to yield product 11 (0.285 g, 97.7 %) as a red solid; m.p. 293 – 296 °C.
