## General

All chemicals were reagent grade and used as purchased. All of the reactions except ester hydrolysis were performed under an argon atmosphere. Reactions were monitored by TLC using Merck TLC silica gel 60 F-254 aluminium sheets. Compounds were visualized by UV light ( 254 and 366 nm ) or by staining with a solution of ninhydrin in ethanol. Column chromatography was carried out on silica gel 60 (0.04-0.063 mm).
Melting points were recorded on a Kofler system. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a BRUKER DPX 250, a Bruker AM 300 or a BRUKER AV 500 spectrometer. Chemical shifts are expressed in parts per million (ppm) relative to the partially nondeuterated solvent signal DMSO- $d_{5}\left(\delta_{\mathrm{H}}=2.50, \delta_{\mathrm{C}}=39.43\right)$ or $\mathrm{CHCl}_{3}\left(\delta_{\mathrm{H}}\right.$ $=7.26, \delta_{\mathrm{C}}=77.00$ ) as an internal reference. IR spectra were recorded with a Perkin Elmer 1600 Series FTIR spectrometer (using a KBr pellet for solids and NaCl plates for liquids) or a Perkin Elmer Spectrum Two FTIR spectrometer equipped with a Perkin UATR Two unit. ESI mass spectrometry was performed on a Fisons VG Platform II spectrometer or on a nano-ESI spectrometer (Perseptive Biosystems, Mariner). High-resolution mass spectra (HRMS) were obtained with a Thermo Scientific MALDI LTQ Orbitrap. Elemental analysis was carried out with a Vario MICRO cube apparatus.

Preparative HPLC of tris(2-aminobenzimidazole) 7 was performed on a Waters pump 590 with a Beckman 163 variable wavelength detector. Analytical HPLC was performed on a JASCO PU-980 with a UV-975 UV/vis detector and a Varian 385-LC detector.

## Synthesis of the tris(2-aminobenzimidazole) derivative 7

Bis-[2-(tert-butoxycarbonylamino)ethyl]-(2-aminoethyl)amine (2). In a similar manner as described in [1], a solution of tris(2-aminoethyl)amine 1 ( 1.42 mL , 9.52 mmol ) in 50 mL of THF (abs.) was cooled to $0^{\circ} \mathrm{C}$. A solution of Boc-ON ( 4.95 g , 20.1 mmol ) in 50 mL of THF (abs.) was added dropwise during 2.5 h . The yellow solution was stirred for 46 h at rt . After removal of the solvent under reduced pressure, the remaining oil was dissolved in 50 mL of ethyl acetate and washed twice with 0.5 M NaOH . The combined aqueous phases were diluted with brine and
reextracted with ethyl acetate thrice. The combined organic phases were dried over $\mathrm{MgSO}_{4}$ and the solvent was evaporated at reduced pressure. After column chromatography of the crude product ( $\mathrm{DCM} / \mathrm{MeOH} 5: 1+1 \% \mathrm{NEt}_{3}$ ), 1.49 g of the product compound were obtained as a yellow oil (45\%). $R_{f}=0.27$ (DCM/MeOH 5:1, $1 \% \mathrm{NEt}_{3}$ ). ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(250 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right): \delta=6.75-6.71(\mathrm{~m}, 2 \mathrm{H}, \mathrm{NH}), 2.98-2.91$ ( $\mathrm{m}, 4 \mathrm{H}, \mathrm{CH}_{2}$ ), $2.54\left(\mathrm{t}, 2 \mathrm{H}, \mathrm{J}=5.8 \mathrm{~Hz}, \mathrm{CH}_{2}\right.$, overlaps with DMSO), $2.44-2.39(\mathrm{~m}, 6$ $\mathrm{H}, \mathrm{CH}_{2}$ ), $1.37\left(\mathrm{~s}, 18 \mathrm{H}, \mathrm{CH}_{3}\right) .{ }^{13} \mathrm{C}-\mathrm{NMR}\left(62.9 \mathrm{MHz}, \mathrm{DMSO}-\mathrm{d}_{6}\right): \delta=155.6,77.3,56.6$, 53.9, 38.3, 28.1. In a similar manner as described in [1], a solution of amine $2(1.46 \mathrm{~g}, 4.20 \mathrm{mmol})$ in 15 mL MeCN (abs.) was added dropwise at $0^{\circ} \mathrm{C}$ to a solution of $1,1^{\prime}$-thiocarbonyl diimidazole ( $1.12 \mathrm{~g}, 6.30 \mathrm{mmol}$ ) and imidazole ( $94 \mathrm{mg}, 1.39 \mathrm{mmol}$ ) in 25 mL MeCN (abs.). The reaction mixture was stirred for 1 h at rt . Methyl 3,4-diaminobenzoic acid ( $1.05 \mathrm{~g}, 6.30 \mathrm{mmol}$ ) was dissolved in 10 mL MeCN (abs.) and added dropwise to the reaction mixture. The solution was stirred for 4 h at $50^{\circ} \mathrm{C}$ and at rt overnight. The solvent was evaporated at low pressure and the residue purified by column chromatography ( $n$-hexane/ethyl acetate $1: 1 \rightarrow$ ethyl acetate), yielding $1.83 \mathrm{~g}(79 \%)$ of the product compound as a yellow foam. $R_{f}=0.48$ (ethyl acetate). ${ }^{1} \mathrm{H}-\mathrm{NMR}\left(250 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right): \delta=8.85$ (br s, $1 \mathrm{H}, \mathrm{NH}-A r y l), 7.60-7.55(\mathrm{~m}, 2 \mathrm{H}$, Aryl-H), 7.33 (br s, $1 \mathrm{H}, \mathrm{NHC}=\mathrm{S}), 6.75(\mathrm{~d}, 1 \mathrm{H}, \mathrm{J}=$ 9.0 Hz, Aryl-H), $6.69-6.61$ (m, $2 \mathrm{H}, \mathrm{NHC=O}$ ), 5.68 (br s, $2 \mathrm{H}, \mathrm{NH}_{2}$ ), 3.74 ( $\mathrm{s}, 3 \mathrm{H}$, $\mathrm{OCH}_{3}$ ), $3.49-3.41\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{NC}=\mathrm{S}\right), 2.97-2.90\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2} \mathrm{NC}=\mathrm{O}\right), 2.60-2.54$ ( $\mathrm{m}, 2 \mathrm{H}, \mathrm{CH}_{2}$ ), $2.48-2.44$ (m, $4 \mathrm{H}, \mathrm{CH}_{2}$, overlaps with DMSO), 1.37 (s, $18 \mathrm{H}, \mathrm{CH}_{3}$ ). ${ }^{13} \mathrm{C}-\mathrm{NMR}\left(125.8 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right): \delta=181.2,165.9,155.6,149.2,130.3,128.9$, 122.0, 116.3, 114.4, 77.5, 53.5, 52.3, 51.3, 42.1, 38.2, 28.2. ## Synthesis of PNA conjugates

Synthesis of PNA 10mers (The method described here closely resembles a method we published earlier [3] for the synthesis of tripeptides unrelated to PNA). PNA 10mers were assembled manually on a solid support (Rink Amide MBHA resin purchased from Novabiochem, now incorporated into Merck Millipore, Darmstadt, Germany) by using 2 mL polyethylene syringe reactors that were equipped with a fritted disc. Peptide nucleic acid monomers were purchased from Link Technologies (Bellshill, UK). Fmoc- ${ }^{\alpha} \mathrm{N}-\mathrm{Lys}\left({ }^{\varepsilon} \mathrm{N}-\mathrm{Boc}\right) \mathrm{OH}, \mathrm{HOBt}$ and DIC were from Sigma-Aldrich. The 10mers were synthesized using the following procedure: After swelling the resin ( 100 mg ) with DCM for 1.5 h , the solvent was substituted by NMP. To release the amine the Fmoc-protected resin was treated with piperidine ( $20 \%$ in DMF) three times ( $15 \mathrm{~min}, 10 \mathrm{~min}, 5 \mathrm{~min}$ ). Thereafter, the resin was washed with NMP 5 times. For coupling, the Fmoc-amino acid or the Fmoc-PNA monomer (3 equiv) was dissolved in 1 mL of NMP together with HOBt (3 equiv) and DIC (3 equiv). After shaking for 5 min it was added to the resin. The mixture was shaken at rt until the Kaiser test showed complete coupling. The resin was repeatedly washed with NMP and the Fmoc group was removed as described before. After washing with NMP for 5 times, subsequent Fmoc-protected monomer was attached using the same procedure as before. For the storage of the fully assembled and still Fmoc-protected PNA 10mer, the resin was washed with DCM for 10 times, dried in vacuo and stored at $-20^{\circ} \mathrm{C}$ until being used for conjugation of the cleaver. A small sample was treated with 1.5 mL of a 9.5:0.25:0.25 mixture of TFA/ $\mathrm{H}_{2} \mathrm{O} /$ TIPS twice ( 3 h and 30 min ). The combined cleaving solutions were evaporated to dryness and the residue was suspended with cold diethyl ether three times and spun down with a centrifuge
(6000 rpm). The pellet was dried in an air flow, redissolved in $\mathrm{H}_{2} \mathrm{O}$ and evaporated to dryness. A mass spectrum (MALDI) was recorded to confirm the complete assembly of the respective 10 mer . MALDI was performed on a Voyager-DE STR spectrometer (Perseptive Biosystems).

Synthesis of PNA 15mers. PNA 15mers were assembled automatically on a solid support (Rink Amide resin), using the manufacturer's protocol for the Biotage Initiator+ Alstra microwave peptide synthesizer with 9-fluorenylmethyloxycarbonyl (Fmoc)-chemistry. Fmoc deprotection was carried out with 20\% piperidine/NMP at rt and PNA monomer coupling was carried out using ethyl (E)-2-cyano-2(hydroxyimino)acetate (Oxyma) and diisopropyl carbodiimide (DIC) as coupling agents under microwave irradiation for 6 min at $75^{\circ} \mathrm{C}$.
Peptide nucleic acid monomers were from Link technologies (Bellshill, UK) and Fmoc- ${ }^{\alpha}$ N-Lys $\left({ }^{\varepsilon}\right.$ N-Boc) OH was from Iris Biotech GmbH (Marktredwitz, Germany). Rink Amide ChemMatrix resin was purchased from Biotage (Uppsala, Sweden). Oxyma (ethyl cyano(hydroxyimino)acetate) and DIC ( $N, N$-diisopropylcarbodiimide) were purchased from Novabiochem (now incorporated into Merck Millipore, Darmstadt, Germany). Solvents and reagents for solid-phase synthesis were synthesis grade from Applied Biosystems (now incorporated into Life Technologies Europe, Stockholm, Sweden) and Iris Biotech GmbH.

Synthesis of PNA conjugates $\mathbf{1 0} \mathbf{- 1 4 . 2 0 \mathrm { mg } \text { of the respective solid phase bound }}$ and fully protected PNA was swollen in DCM for 30 min , repeatedly washed with DMF and then treated with piperidine ( $20 \%$ in DMF) for three times (15, 10 and 5 min ) to liberate the terminal amino group. Afterwards, the resin was washed with DMF 5 times. For the coupling of the linker, Fmoc protected 6 -aminohexanoic acid ( $25 \mathrm{mg}, 72 \mu \mathrm{~mol}$ ) was dissolved in $360 \mu \mathrm{~L}$ DMF and HOBt ( $11 \mathrm{mg}, 72 \mathrm{mmol}$ ) and DIC $(11 \mu \mathrm{~L}, 72 \mu \mathrm{~mol})$ were added. The solution was shaken for 5 min and then added to the resin bound PNA. The mixture was shaken at rt overnight until the Kaiser test showed complete coupling. The resin was repeatedly washed with DMF, treated with piperidine ( $20 \%$ in DMF) for three times (15, 10 and 5 min ) and again washed with DMF 5 times. For the coupling of the cleaver, trisaminobenzimidazole 8 ( 50 mg , $72 \mu \mathrm{~mol}$ ) was dissolved in $360 \mu \mathrm{~L}$ DMF and $\mathrm{HOBt}(11 \mathrm{mg}, 72 \mu \mathrm{~mol}), \mathrm{NEt}_{3}(40 \mu \mathrm{~L}$, $0.29 \mathrm{mmol})$ and DIC ( $11 \mu \mathrm{~L}, 72 \mu \mathrm{~mol}$ ) were added. The solution was shaken for 5 min
and then added to the resin bound PNA. The mixture was shaken at rt for 72 h until the Kaiser test showed almost complete coupling. The resin was washed with DMF, DCM and MeOH 5 times respectively, dried in vacuo and treated with 1.5 mL of a 9.5:0.25:0.25 mixture of $\mathrm{TFA} / \mathrm{H}_{2} \mathrm{O} /$ TIPS twice ( 3 h and 30 min ). The combined cleaving solutions were evaporated to dryness and the residue was suspended with cold diethyl ether three times and spun down with a centrifuge ( 6000 rpm ). The pellet was dried in an air flow, redissolved in $\mathrm{H}_{2} \mathrm{O}$, evaporated to dryness and purified by HPLC.

HPLC purification of PNA conjugates. PNA conjugates were purified by RP-HPLC. Preparative HPLC of conjugate 10 was performed on a JASCO PU-2080 with a UV2075 UV-vis detector. Analytical HPLC of conjugate 10 and analytical as well as preparative HPLC of conjugates 11, 12, 13, and 14 was performed on a JASCO PU980 with a UV-975 UV/vis detector and a Varian 385-LC detector. Columns were heated to $50^{\circ} \mathrm{C}$.
