*1.1 General*

All reagents used for reactions and preparative chromatography were distilled. Solvents used in reactions were pre-dried in their reagent bottles and then distilled over the appropriate drying medium under a nitrogen atmosphere. Acetonitrile, dichloromethane and methanol were distilled from calcium hydride. Triethylamine was distilled from, and stored over, potassium hydroxide. Acetic anhydride was distilled before storage over 4 Å molecular sieves. *p*-Toluenesulfonyl chloride was purified according to Perrin et al. [1] before use, and stored in a desiccator until required. All reactions were performed under an inert atmosphere (either dry nitrogen or argon) using a standard manifold line connected to a vacuum pump. The *R*ₚ values quoted are for thin layer chromatography (TLC) on aluminium-backed Macherey-Nagel ALUGRAMSii G/UV254 plates pre-coated with 0.25 mm silica gel 60, or Aldrich TLC plates (silica gel on aluminium). Macherey-Nagel Silica gel 60 (particle
size 0.063–0.200 mm) was used as the adsorbent for conventional preparative column chromatography, with a silica to product ratio of 30:1. The elution process was performed using the indicated solvent mixtures either under gravity or air pump pressure conditions. Whatman Partisil Prep 40 (particle size 0.040–0.063 mm) was used for preparative flash chromatography. Concentration or evaporation in vacuo refers to the removal of solvent under reduced pressure (~20 mm Hg, 45 °C) on a rotary evaporator and final drying on an oil pump (~1–2 mm Hg) at room temperature. Intermediates 3, 5 and 6 were prepared as described previously [2].

All melting points were obtained on a Reichert hot-stage microscope, and are uncorrected. Infrared spectra were obtained on a Bruker Vector 22 spectrometer, or a Varian 800FTIR spectrometer (Scimitar Series). The absorptions are reported on the wavenumber (cm⁻¹) scale, in the range 400–4000 cm⁻¹. Hydrogen (¹H NMR) and carbon (¹³C NMR) nuclear magnetic resonance spectra were recorded on a Bruker Avance-300 instrument at 300.13 MHz and 75 MHz, respectively using standard pulse sequences. The probe temperature for all experiments was 300±1 K. All spectra were recorded in deuterated chloroform (CDCl₃) in 5 mm NMR tubes. Chemical shifts are reported in parts per million (ppm) relative to tetramethylsilane as internal standard in the case of ¹H NMR spectra, and relative to the central signal of deuterated chloroform taken at δ 77.16 for the ¹³C NMR spectra. High-resolution mass spectra were recorded on a VG7-SEQ Double Focussing Mass Spectrometer at 70 eV and 200 mA. The polarity was positive, ionisation employed was EI with a resolution of 3000, a mass range of 3000 amu (8 kV) and a scan rate of 5 s/decade.
1.2 General procedure for the sulfide contraction of 3-(2-thioxo-1-pyrrolidinyl)propyl acetate (3)

The thiolactam 3 (1 equiv) [2] and the relevant halide (1.05 equiv) were stirred at rt in dry CH$_2$Cl$_2$ (2 mL mmol$^{-1}$) for 5 h. The solvent was removed under high vacuum, and the resulting salt was stirred at rt for 18 h to complete the reaction. The salt was dissolved in MeCN (3 mL mmol$^{-1}$), to which was added a solution of PPh$_3$ (1.05 equiv) and dry NEt$_3$ (1.05 equiv) in MeCN (3 mL mmol$^{-1}$). The mixture was then stirred at rt for 5 h, during which time a white precipitate was formed. The solution was filtered through a pad of celite and evaporated in vacuo. The residue was taken up in EtOAc (10 mL mmol$^{-1}$), triturated for 30 min and again filtered through a pad of celite. The filtrate was extracted with HCl (2 M, 3 × 10 mL mmol$^{-1}$), the aqueous extracts were brought to pH 11 with aq. NH$_3$ solution (35%) and back-extracted with CH$_2$Cl$_2$ (3 × 10 mL mmol$^{-1}$). The organic extracts were combined, dried (MgSO$_4$), filtered and evaporated in vacuo to yield the crude products 7. The products were purified by column chromatography on silica gel.

General procedure for acetate hydrolysis

To a stirred solution of the required enaminone 7 in MeOH (3.6 mL mmol$^{-1}$) was added K$_2$CO$_3$ (1.1–2.0 equiv). After 3 h the mixture was filtered through celite. The aqueous phases were back extracted with CHCl$_3$ (3 $\times$ 10 mL mmol$^{-1}$), dried (MgSO$_4$) filtered and evaporated in vacuo to afford the crude product. The crude mixture was purified by column chromatography to yield the desired alcohols 8.

General procedure for the tosylation of alcohols 8

To a solution of p-toluenesulfonyl chloride (1.4 equiv) in CH$_2$Cl$_2$ (9 mL mmol$^{-1}$) at rt was added NEt$_3$ (9.8 equiv) and DMAP (0.1 equiv).
