Experimental

General: The reactions were performed with commercial reagents purchased from Sigma-Aldrich, Acrōs Organics, or Merck. Flash column chromatography was carried out on silica gel 60 (0.040–0.060 mm, Merck or 0.035–0.075 mm, Acrōs Organics) using distilled solvents (toluene, ethylacetate, chloroform, methanol). Dichloromethane and acetonitrile were dried (CaH₂) and distilled before use. All reactions using sensitive reagents were carried out under an argon atmosphere. Molecular sieves (4 Å) were microwave-dried before use. TLC was performed on aluminium sheets precoated with silica gel 60 F₂₅₄ (Merck). Spots were visualized by UV light (λmax = 254 nm) and charred with 5% sulfuric acid in ethanol (1% orcinol). Melting points were recorded with a Kofler hot block and are uncorrected. ¹H NMR and ¹³C NMR spectra were recorded at 25 °C with a 300 MHz Bruker AM 300 spectrometer, 400 MHz Varian 400 NMR spectrometer or a 400 MHz Bruker AVANCE III HD 400 MHz equipped with a Prodigy CryoProbe. Chemical shifts are referenced to either TMS (δ 0.00, CDCl₃ for ¹H) or HOD (δ 4.79, CD₃OD for ¹H), and to internal CDCl₃ (δ 77.16, ¹³C) or CD₃OD (δ 49.00, ¹³C). Optical rotations were measured on Perkin–Elmer 241 and Jasco P2000 polarimeters at 20 °C. High resolution mass spectrometry was performed on a Premier Q-TOF mass spectrometer (Waters) or an Orbitrap Velos PRO spectrometer (Thermo Fisher Scientific).

General procedure for the preparation of 6a–c: To a stirred solution of aldehyde 4a–c (40 mmol) in dry pyridine (25 mL) acetic anhydride (25 mL) was added at 0 °C. The mixture was then stirred at rt for 10 h, then diluted with ice-cold water (200 mL), and stirred for another 2 h. The aqueous layer was extracted with EtOAc (2 x 100 mL), the combined organic phase was washed with water (3 x 50 mL), dried (Na₂SO₄) and concentrated. The conversions of the acetylation reactions were at least 98%. The crude acetylated aldehyde 5a–c (20 mmol) was dissolved in MeOH (50 mL) and cooled to −5 °C. Under stirring, NaBH₄ (1.2 equiv) and 85% H₃PO₄ (0.4 equiv) were added in three portions and the progress of the reduction was monitored by TLC (CHCl₃/MeOH 9.5:1). When the reaction was complete, the pH of the...
reaction mixture was adjusted to pH 5 using 85% H₃PO₄, salts were removed by filtration and the solvent was evaporated. The residue was dissolved in EtOAc (50 mL), washed with water (3 x 50 mL), brine (50 mL), dried (Na₂SO₄) and concentrated. Purification by column chromatography (CHCl₃/MeOH 1:0 →9.5:1) gave the desired alcohols 6a–6c.

General procedure for preparation of 9 and 12: Acid 7 or 10 (50 mmol) was suspended in acetic anhydride (15 mL) and 2 drops of conc. H₂SO₄ were added at 5 °C. The mixture was stirred for 30 min at rt, then diluted with ice-cold water (200 mL), and stirred for additional 2 h. The aqueous layer was extracted with EtOAc (2 x 150 mL), the combined organic phase was washed with water (3 x 50 mL), dried (Na₂SO₄) and concentrated. Conversions for acetylation reactions were at least 94%. The crude acetylated acids were crystalized from aqueous ethanol. The crude acetylated carboxylic acid 8 or 11 (20 mmol) was dissolved in THF (80 mL) and NaBH₄ (0.9 g, 24 mmol) was added in portions at 5 °C. The reaction mixture was stirred until gas evolution ceased. Next, iodine (2.54 g, 10 mmol) dissolved in
THF (20 mL) was added dropwise into the stirred mixture over 15 min at 5 °C. Additional H₂ gas evolved and the red colour of iodine disappeared. The reaction mixture was stirred for 3 h at rt, then 3 M HCl (10 mL) was carefully added at 5 °C. Tetrahydrofuran was removed by evaporation and the mixture was extracted with diethyl ether (3 x 20 mL). The ethereal layer was washed with saturated NaHCO₃ (20 mL), Na₂S₂O₃ (20 mL) and brine (2 x 20 mL), dried (Na₂SO₄) and the solvent was evaporated. TLC (CHCl₃/MeOH 9:1) showed that the residues still contained traces of the deacetylated products. Column chromatography on silica gel (toluene/EtOAc 3:1) afforded 9 or 12, respectively.

**General procedures for the syntheses of donors:** Glycosyl bromides 13, 15, 16, 18 and 20 were prepared from the corresponding peracetylated sugars according to previously reported procedures [3]. 2,3,4,6-Tetra-O-acetyl-1-O-trichloroacetimidoyl-β-D-glucopyranoside (14) [4], methyl 2,3,4-tri-O-acetyl-α-D-glucopyranosyluronate bromide (17) [5] and acetylated L-arabinofuranosyl bromide 19 [6] were prepared according to published methods.
General procedures for glycosylation reactions

**Method A, promoter Ag₂O:** 2,3,4,6-Tetra-O-acetyl-D-glucopyranosyl bromide (13, 0.41 g, 1.0 mmol), (4-acetoxy-3-methoxy)benzyl alcohol (6b, 0.22 g, 1.15 mmol) and activated 4 Å molecular sieves (1.0 g) were stirred in dry DCM (20 mL) under argon atmosphere in the dark for 30 minutes. Then the mixture was cooled to 0 °C, Ag₂O (0.46 g, 2.0 mmol) was added and stirring was continued for 2 h at rt. The solution was diluted with DCM (100 mL), filtered through a pad of Celite, the organic phase washed with water (2 x 50 mL), dried (Na₂SO₄) and concentrated. Purification of the residue by column chromatography (toluene:EtOAc 1:0 → 3:1) gave 21b.

**Method B, promoter ZnO–ZnCl₂:** Glycosyl bromide (1.0 mmol) and the acetylated arylalkyl alcohol (1.15 mmol) were dissolved in dry DCM (10 mL) containing activated 4 Å molecular sieves (0.8 g). ZnO (1.2 mmol) and ZnCl₂ (1.2 mmol) were added to the stirred solution and the reaction mixture was stirred under an Ar atmosphere at rt for 1.5 h. Then the mixture was filtered and the solid residue was washed with DCM (100 mL). The organic filtrates were combined, washed with satd NaHCO₃ (30 mL) and brine (2 x 50 mL), dried (Na₂SO₄) and concentrated. The crude product was purified by column chromatography (toluene/EtOAc 1:0 →3:1).

**Method C, promoter DDQ–I₂:** Glycosyl bromide (1.0 mmol), acetylated arylalkyl alcohol (1.15 mmol), activated 4 Å molecular sieves (0.4 g, optional), were stirred in dry CH₃CN (10 mL), or optionally DCM (10 mL) under argon atmosphere. To this solution, DDQ (0.25 mmol) and I₂ (0.5 mmol) were added. When TLC (toluene/EtOAc 1:1) indicated the completion of the reaction, the reaction mixture was diluted with CHCl₃ (100 mL), molecular sieves were filtered off, saturated Na₂S₂O₃ (40mL) was added and the mixture was stirred for 30 min. The layers were separated, the organic phase was washed with brine (2 x 50mL), dried (Na₂SO₄) and concentrated. The crude product was purified by column chromatography (toluene/EtOAc 1:0→6:1).
**Method D, promoter ZnO–I₂**: Glycosyl bromide (1.0 mmol) and acetylated arylalkyl alcohol (1.15 mmol) were dissolved in dry DCM (10 mL), optionally containing activated 4 Å molecular sieves (0.8 g), and ZnO (2.4 mmol) and I₂ (1.0 mmol) were added. The reaction mixture was then stirred under argon atmosphere at rt until completion of the reaction (TLC). Then the reaction mixture was filtered, saturated Na₂S₂O₃ (50 mL) was added and the mixture was stirred until decolorisation. Afterwards the organic phase was separated, washed with saturated NaHCO₃ (30 mL) and brine (2 x 50 mL), dried (Na₂SO₄) and concentrated. The crude product was purified by column chromatography (toluene/EtOAc 1:0 → 3:1).

**Method E, promoter TMSOTf**: Trichloroacetimidate 14 (1.0 mmol) and acceptor 12 (1.2 mmol) were dissolved in DCM (6 mL) and activated 4 Å molecular sieves (0.5 g) were added. The mixture was stirred for 30 min at −20 °C under argon atmosphere, then cooled to −78 °C and TMSOTf (cat., 10 μL) was added and the stirring was continued for further 30 min after which the temperature was brought up to 0 °C. The reaction mixture was neutralized by addition of Et₃N and concentrated. The crude product was purified by column chromatography (toluene/EtOAc 5:1 → 3.5:1) to give 23.
