Typical Experimental Procedure, ¹H and ¹³C NMR spectra of compounds 7, 8, 11, 15

Table of Content:

1. General information S2
2. Typical experimental procedure S2
3. ¹H and ¹³C NMR spectra of compounds 7, 8, 11, 15 S3
1. **General Information**

In all reactions were carried out with commercial reagents without further purification. Progress of reactions was monitored by TLC on pre-coated Merck silica gel plates (60F-254) and GC MS. Visualization of reactants and products was accomplished with UV light and alkaline KMnO₄. Column chromatography was performed with a Combiflash Companion automated (ISCO) flash chromatography system. The ¹H NMR and ¹³C NMR spectra were run on a Bruker Avance 600 NMR Spectrometer with CDCl₃ as solvent and TMS as an internal standard. GC MS analysis was carried out Agilent 5973i Mass spectral Detector attached to Agilent 6890 Gas Chromatograph.

2. **Typical experimental procedure for conversion of thiocyanates to thiols**

In three neck round bottom flask, to a solution of thiocyanate (10 mmol) in toluene (25 mL), P₂S₅ (2.22 g, 10 mmol) was added and resulting suspension was refluxed till complete consumption of the starting material (TLC). After the reaction was complete, the reaction mixture was quenched by careful addition of water (10 ml), extracted with ethyl acetate (3 × 10 mL), the organic phase was dried over sodium sulfate and evaporated under reduced pressure to get the crude product which was purified by flash chromatography (hexane–ethyl acetate) to get the corresponding thiol.
