General experimental and characterization details:

Reactions were carried out in oven-dried glassware under a nitrogen atmosphere. Solvents were dried and purified using a JC Meyer solvent purification system, and were used without further purification. Transfer of anhydrous solvents and reagents was accomplished with oven-dried syringes. Thin-layer chromatography was performed on glass plates pre-coated with 0.25 mm silica gel 60 F254 (Silicycle). Flash chromatography columns were packed with 230–400 mesh silica gel (Silicycle). Radial chromatography was carried out on a Chromatotron 7924T (Harrison Research) equipped with 4 mm silica gel 60 F254 with gypsum binder (EM) thick-layer plates on glass rotors. Infrared spectra were recorded on a Perkin Elmer FT-IR Spectrum Two with ATR Two. Proton NMR spectra (¹H NMR) were recorded at 300 or 500 MHz, and are reported (ppm) relative to the residual chloroform peak (7.26 ppm), and coupling constants (J) are reported in hertz (Hz). Carbon NMR spectra (¹³C NMR) were recorded at 125 or 75 MHz and are reported (ppm) relative to the center line of the triplet from CDCl₃ (77.16 ppm). High resolution mass spectroscopy was performed on a Thermo Fisher Scientific Q-Exactive hybrid mass spectrometer equipped with an Agilent HPLC pump interfaced with the Q-Exactive’s APCI source.

General procedure for allene synthesis:¹

![Chemical diagram]

Step 1: In an oven dried flask, was added methyl triphenylphosphonium bromide (1.2 equiv) followed by THF (2.5 mL/mmol). Then t-BuOK (1.2 equiv) was added and the resulting yellow suspension was stirred at room temperature for 60 min. To this suspension, a solution of ketone or aldehyde (1.0 equiv) was added in one portion and the resulting mixture was further stirred at room temperature overnight. Water and DCM were added to the reaction mixture, and the aqueous phase was extracted with DCM (3 × 50 mL). The combined organic phases were washed with saturated NaCl solution, dried over Na₂SO₄ and the solvent removed under reduced pressure. The reaction mixture was purified by column chromatography over silica gel (200–300 mesh) using hexanes as eluent afforded S1.

Step 2: To a solution of alkene S₁ (1.0 equiv), bromoform (1.5 equiv) and BnNEt₃Cl (1 mol %) was added dropwise a solution of 50% NaOH (4.0 equiv), and the mixture was stirred at room temperature for 60 min, then heated to 60 °C and further stirred until conversion was complete as observed by TLC analysis. Water and DCM were added and the aqueous phase was extracted with DCM (3 × 50 mL). The combined organic phases were washed with saturated NaCl solution, dried over Na₂SO₄ and the solvent removed under reduced pressure. The reaction mixture was purified by column chromatography afforded S₂.

Step 3: EtMgBr (3.0 M in ether, 1.5 equiv) was added dropwise to a pre-cooled (ice-bath) solution of S₂ (1.0 equiv) in dry THF (1.0 mL/mmol) under nitrogen atmosphere. After EtMgBr was added the mixture was then slowly warmed to room temperature, and stirred at room temperature for an additional 2 hours. Then the reaction was quenched by HCl (0.5 N, 10 mL) solution, water was added, and the mixture extracted with ether (3 × 50 mL). The combined organic layers were washed with brine, dried with anhydrous Na₂SO₄ and filtered. After removing the solvent under reduced pressure, the crude product was purified by column chromatography on silica gel to afford allenes 2a–v.

**General procedure for chlorination of allenes:**

To an oven dried flask with a magnetic stir bar was charged 1-chloro-1,2-benziodoxol-3-one (1b, 0.44 mmol, 2.2 equiv) and acetonitrile (1 mL), and the resulting solution was placed under a nitrogen atmosphere. The reaction flask was immersed in a preheated 85 °C oil bath and stirred. To this, a solution of allenes 2a–v (0.2 mmol, 1.0 equiv) in acetonitrile (1 mL) was added by syringe pump over 60 min. Then the reaction was monitored by TLC analysis, and upon consumption of the allene (∼1 h), the reaction mixture was cooled to room temperature and concentrated under vacuum by rotary evaporation. The resulting crude product mixture was purified by silica gel chromatography to provide the chlorination products 3a–4v.

**Ph$_3$PCD$_3$Br:**$^{10}$ To a flask with a magnetic stir bar was added Ph$_3$PMeBr (530mg, 1.5 mmol, 1.0 equiv), D$_2$O (2 mL), and NaOH (30 mg, 0.75 mmol, 0.5 equiv). The reaction mixture was stirred under nitrogen atmosphere, and after 24 h, CH$_2$Cl$_2$ (5 mL) was added to the solution and organic layer was collected and dried with Mg$_2$SO$_4$. Then added Hexanes (10 mL) to the resulting solution and storing at $-5^\circ$C for 24 h afforded colorless crystals (460 mg, 86% yield). $^1$H NMR (300 MHz, CDCl$_3$) $\delta$ 7.71 (m, 15H). $^2$H NMR (46 MHz, CHCl$_3$) $\delta$ 3.41 (s, 3H).

[D$_2$]-S1-b: In an oven dried flask, methyl triphenylphosphonium bromide (1.0 mmol, 356 mg, 1.0 equiv) was added with THF (2.5 mL/mmol). Then 2.6M n-BuLi (1.2 mmol, 0.4 mL, 1.2 equiv) was added and the resulting yellow suspension was stirred in an ice-bath for 60 minutes. To this suspension, a solution of [1,1'-biphenyl]-4-carbaldehyde (1.0 mmol, 182 mg, 1.0 equiv.) was added in one portion and the resulting mixture was warmed to room temperature and further stirred at room temperature overnight. Water and DCM were added to the reaction mixture, separated and the aqueous phase was extracted with DCM (3 $\times$ 15 mL). The combined organic phases were washed with saturated NaCl solution, dried over Na$_2$SO$_4$ and the solvent removed under reduced pressure. The reaction mixture was purified by column chromatography over silica gel (200–300 mesh) using Hexanes as eluent afforded colorless solid [D$_2$]-S1-b (135 mg) in 74% yield. $^1$H NMR (500 MHz, CDCl$_3$) $\delta$ 7.60 (d, $J$ = 7.6 Hz, 2H), 7.57 (d, $J$ = 7.9 Hz, 2H), 7.49 (d, $J$ = 8.0 Hz, 2H), 7.44 (t, $J$ = 7.6 Hz, 2H), 7.35 (t, $J$ = 7.5 Hz, 1H), 6.75 (s, 1H). $^{13}$C NMR (126 MHz, CDCl$_3$) $\delta$ 141.4, 141.2, 137.2, 137.0, 136.9, 129.4, 128.0, 127.9, 127.6, 127.3. $^2$H NMR (46 MHz, CHCl$_3$) $\delta$ 5.95 (d, $J$ = 2.7 Hz, 1H), 5.42 (d, $J$ = 2.7 Hz, 1H).

[D$_2$]-S2-b and [D$_2$]-2b were prepared following the general procedure for allene synthesis given above.$^2$

Synthesis of 4-(2,3-dichloroprop-1-en-1-yl-3,3-d₂)-1,1'-biphenyl ([D₂]-3b):

To an oven dried flask with a magnetic stir bar was charged 4-(propa-1,2-dien-1-yl-3,3-d₂)-1,1'-biphenyl ([D₂]-2b, 0.2 mmol, 39 mg, 1.0 equiv), 1-chloro-1,2-benziodoxol-3-one (1b, 0.44 mmol, 133 mg, 2.2 equiv) and acetonitrile (2 mL), and the resulting solution was placed under a nitrogen atmosphere. The reaction flask was immersed in a preheated 85 °C oil bath, and stirring. The reaction was monitored by TLC analysis, and upon consumption of the [D₂]-2b (10–30 min), the reaction mixture was cooled to room temperature and concentrated by under vacuum by rotary evaporation. The resulting crude product mixture was purified by silica gel chromatography to provide [D₂]-3b in 79% yield (E/Z=1/2). (E)-[D₂]-3b: ¹H NMR (300 MHz, CDCl₃) δ 7.67 – 7.48 (m, 4H), 7.52 – 7.30 (m, 5H), 6.94 (s, 1H).
