**General methods:** Air and/or moisture-sensitive reactions were carried out in anhydrous solvents under an argon atmosphere in predried glassware. CH$_2$Cl$_2$ was freshly distilled from CaH$_2$. All commercially available reagents were used without purification. Column chromatography was carried out on silica gel (100–200 mesh). NMR spectra were recorded on a Bruker Avance III 400 spectrometer operating at 400 MHz ($^1$H) and 101 MHz ($^{13}$C). $^1$H and $^{13}$C NMR chemical shifts are reported in ppm relative to chloroform-$d$ ($\delta = 7.26$ for $^1$H and 77.16 for $^{13}$C) or TMS (0.0 ppm) and coupling constants ($J$) are reported in hertz (Hz). The following abbreviations have been used to designate signal multiplicity: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, br = broad. IR spectra were recorded as films on a Bruker FT-IR. TOF-ESI-HSMS ($m/z$) was recorded on a Waters Micromass LCT premier instrument at 70 eV in the positive or negative mode. APCI-HRMS was recorded on a Bruker Maxis Impact QTOF instrument using the APCI solid probe.

**General procedure for the synthesis of 1,4-diketones**

Under an argon atmosphere, BF$_3$·OEt$_2$ (1.25 equiv) was added to a slurry of hydroxy(tosyloxy)iodobenzene (1.25 equiv) in anhydrous CH$_2$Cl$_2$ (8 mL) at room temperature resulting in a clear yellow solution. The solution was cooled to $-78 \, ^\circ\text{C}$, and the first trimethylsilyl enol ether (1.0 equiv) dissolved in CH$_2$Cl$_2$ (4 mL) was added slowly. After 10 minutes the second trimethylsilyl enol ether (1.2–1.4 equiv) dissolved in CH$_2$Cl$_2$ (2 mL) was added dropwise. The reaction mixture was stirred for 10 min at $-78 \, ^\circ\text{C}$ and then allowed to warm to room temperature. Stirring was continued for 1 h in total. The reaction mixture was quenched by the addition of H$_2$O (5 mL) and then extracted with CH$_2$Cl$_2$ (3 × 10 mL). The combined organic extracts were dried over anhydrous Na$_2$SO$_4$ and concentrated in vacuo. The residue was subjected to silica gel column chromatography to isolate the corresponding 1,4-diketone product(s).
1-(4-Methoxyphenyl)-4-phenylbutane-1,4-dione (8): Cross-coupling of 1-phenyl-1-trimethylsiloxyethylene (192 mg, 1.0 mmol) with 1-(4-methoxyphenyl)-1-trimethylsiloxyethylene (311 mg, 1.4 mmol) following the general procedure gave 1-(4-methoxyphenyl)-4-phenylbutane-1,4-dione (193 mg, 72%) as white solid; \( R_f \): 0.4 (1:4 v/v EtOAc/hexane).
