#### Determination of energy difference of conformers:

#### **Application of Boltzmann equation:**

The energy differences in of the conformers were calculated using equation  $(1)^1$ ,

$$\frac{N_i}{N_j} = e^{\frac{-(E_i - E_j)}{kT}} \to \ln \frac{N_i}{N_j} kT = -(E_i - E_j)$$

$$\tag{1}$$

where  $N_i$  is the population of conformer *i*,  $N_j$  is the population of conformer *j*, *k* is the Boltzmann constant (kcal mol<sup>-1</sup>), *T* is the temperature of measurement (233.15 K).

**1a** (MeCN, -40 °C): 
$$\ln \frac{4}{3} 0.001987 \times 233.15 = -(E_i - E_j) = 0.13 \, kcal/mol$$

**1b** (MeCN, -40 °C): 
$$\ln \frac{82}{1} 0.001987 \times 233.15 = -(E_i - E_j) = 2.04 \, kcal/mol$$

### **Computational details**

Computational methods available in Spartan '18 software<sup>2</sup> were employed to determine geometries and properties of macrocycle conformers. The structures of **1a-1**, **1a-2**, **1b-1** and **1b-2** were built in silico. The geometry of the structures were optimized at the CAM-B3LYP/6-31G(d) level of theory using C-PCM solvation model of acetonitrile.

### X-ray crystallography

Diffraction data were collected at 120 K on Rigaku Saturn944+ diffractometer with graphite-monochromated Mo K $\alpha$  radiation. The structures were solved by direct methods and refined using ShelXTL software package<sup>3</sup>.
