Materials. All reagents were commercially available and used as supplied without further purification. Compounds **2** and **4** were synthesized according to reported methods [1,2].

Measurements. All variable temperature NMR, ¹H NMR and ¹³C NMR spectra were recorded on a Bruker AscendTM 400 or 500 MHz spectrometer. The transmittance experiments were measured at 550 nm using a SHIMADZU 2600 UV–vis/NIR spectrometer with a temperature controllable system. Unless otherwise stated, samples were dissolved in Milli-Q water. High resolution mass spectrometry was performed on a Shimadzu Biotech AXIMA Performance instrument.

Synthesis of 2.

To a solution of **B21C7-CHO** (0.9 g, 2.3 mmol) in THF (50 mL) was added slowly LiAlH₄ (0.3 g, 6.9 mmol) in a three-necked flask under N₂ at 0 °C. After the mixture was refluxed overnight, Na₂SO₄·10H₂O was added to the mixture until there were no more bubbles generated. Then the mixture was filtered and THF was removed followed by extraction with CH₂Cl₂ three times. The organic phases were combined, washed with water, dried over Na₂SO₄. After filtration and solvent evaporation, product **2** was obtained as pale oil (0.74 g, 83.4%).

Synthesis of 4.

B21C7-CN (2.55 g, 6.67 mmol) was added to 1 M borane-tetrahydrofuran complex (66.9 mL, 66.9 mmol) at 0 °C. The solution was stirred for 30 min at 0 °C, and heated to reflux for 20 h. The reaction mixture was cooled to 0 °C, and CH₃OH (30 mL) was added dropwise. Hydrochloric acid (1 mL, 37% in water) was added slowly, the mixture stirred for 1 h and subsequently evaporated to dryness under reduced pressure. Trimethyl borate was removed by three subsequent coevaporations with methanol. Sodium hydroxide solution (80 mL, 1 M in water) was added to the viscous liquid, followed by extraction with CH₂Cl₂. The combined S2

organic layers were dried over anhydrous Na₂SO₄, filtered, and the solvent was evaporated on a rotary evaporator yielding a yellow oil (1.86 g, 74.5%)

Syntheses of 3a–e and 5a–e. Dibutyltin dilaurate (DBTDL) (1 drop) was added to the mixture of 1 (0.25 g of 1a, 0.25 g of 1b, 0.30 g of 1c, 0.34 g of 1d or 0.42 g of 1e, 3.0 mmol) and 2 (0.38 g, 1.0 mmol) or 4 (0.38 g, 1.0 mmol) in dichloromethane. The reaction mixture was stirred at room temperature for one day. Then, water was added to quench the reaction, and the organic phase was separated, concentrated and the residue was subjected by column chromatography (10:1, $CH_2Cl_2/MeOH$, *v:v*) to give 3 or 5 as white solids.

Figure S37: (a) Turbid curve for **3b** (15.0 mg/mL) measured at 550 nm. The rates for heating and cooling are 1.0 °C/min. (b) Concentration-dependent turbidity curve for **3b** with a heating rate at 1.0 °C/min. (c) T_{cloud} of **3b** at different concentrations with a heating rate at 1.0 °C/min. (d) Turbidity curve for **3b** (15.0 mg/mL) measured at different heating rates.

Figure S38: (a) Turbid curve for **3c** (6.8 mg/mL) measured at 550 nm. The rates for heating and cooling are 1.0 °C/min. (b) Concentration-dependent turbidity curve for **3c** with a heating rate at 1.0 °C/min. (c) T_{cloud} of **3c** at different concentrations with a heating rate at 1.0 °C/min. (d) Turbidity curve for **3c** (6.8 mg/mL) measured at different heating rates.

Figure S39: (a) Turbid curve for **3d** (4.0 mg/mL) measured at 550 nm. The rates for heating and cooling are 1.0 °C/min. (b) Concentration-dependent turbidity curve for **3d** with a heating rate at 1.0 °C/min. (c) T_{cloud} of **3d** at different concentrations with a heating rate at 1.0 °C/min. (d) Turbidity curve for **3d** (4.0 mg/mL) measured at different heating rates.
