Experimental details and characterization data
General information
For thin-layer chromatography (TLC), Merck pre-coated TLC plates (silica gel 60 F\textsubscript{254}) were employed. The purification of the products was performed using column chromatography with silica gel (high-purity grade 9385, pore size 60 Å, 230–400 mesh particle size). The melting points were determined in capillary tubes using a capillary melting point apparatus (Electrothermal MEL-TEMP\textsuperscript{®}) and are uncorrected. The \textsuperscript{1}H, \textsuperscript{13}C and \textsuperscript{15}N NMR spectra were recorded in CDCl\textsubscript{3} solutions at 25 °C on a Bruker Avance III 700 (700 MHz for \textsuperscript{1}H, 176 MHz for \textsuperscript{13}C, 71 MHz for \textsuperscript{15}N) spectrometer equipped with a 5 mm TCI \textsuperscript{1}H-\textsuperscript{13}C/\textsuperscript{15}N/D z-gradient cryoprobe. The chemical shifts, expressed in ppm, are reported relative to tetramethylsilane (TMS). The \textsuperscript{15}N NMR spectra are referenced to neat, external nitromethane (coaxial capillary). The complete and unambiguous assignments of the \textsuperscript{1}H, \textsuperscript{13}C and \textsuperscript{15}N resonances were achieved using standard Bruker software in conjunction with standard NMR spectroscopic techniques, such as DEPT, COSY, TOCSY, NOESY, gs-HSQC and gs-HMBC. The infrared spectra were recorded on a Bruker Vertex v70 FTIR spectrometer equipped with a diamond ATR accessory. HRMS spectra were recorded with a Bruker micrOTOF-QIII spectrometer. Starting materials and catalysts were purchased from Sigma-Aldrich and Fluorochem and used as received without further purification. Compound 3a was prepared in accordance with the procedure reported elsewhere [1].

General procedure for the preparation of 4-alkynyl-1-phenyl-1H-pyrazol-3-ols 3b–j
To a solution of 4-iodo-1-phenyl-1H-pyrazol-3-ol (2, 1 mmol) in dry DMF (2 mL) under an argon atmosphere was added TEA (0.7 mL, 5 mmol), the appropriate ethyne (1.5 mmol), Pd(PPh\textsubscript{3})\textsubscript{2}Cl\textsubscript{2} (70 mg, 0.1 mmol) and CuI (36 mg, 0.2 mmol). The mixture was stirred under an argon atmosphere at 58 °C for the given time, and subsequently diluted with water and extracted with ethyl acetate. The combined organic layers were washed with brine and dried over Na\textsubscript{2}SO\textsubscript{4}, and the solvent was evaporated. The residue was purified by flash chromatography (SiO\textsubscript{2}, eluent: ethyl acetate/n-hexane 1:6, v/v) to yield compounds 3b-j.

X-ray analysis of compound 4d

The X-ray intensity data was measured on a Bruker-Nonius KappaCCD diffractometer equipped with graphite monochromator, Mo Kα INCOATEC micro focus sealed tube and Cryostream 700 cooling device. The structure was solved by direct method and refined by full-matrix least-squares techniques. Non-hydrogen atoms were refined with anisotropic displacement parameters. Hydrogen atoms were fitted to the peaks of the difference synthesis as well as calculated geometrically and refined with a riding model. The following software was used: DENZO and HKL SCALEPEAK software package [2] using a narrow-frame algorithm for frame integration, no absorption correction due to small absorption coefficient, SIR-92 [3] for structure solution, refinement molecular diagrams and graphical user-interface, SHELXL [4] for refinement and graphical user-interface, Platon [5] for symmetry check and Cg(Pi-Ring) interactions calculations. Experimental data and CCDC-code can be found in Table S1. Crystal data, data collection parameters, and structure refinement details are given in Tables S2 and S3. Molecular structure in “Ortep View” is displayed in Figure S1 and arrangement of enantiomers in the crystal is displayed in Figure S2.
