## 3. Experimental part

### 3.1 General

The chemicals used for the synthesis of the phosphoramidite building block were purchased from Sigma-Aldrich, Acros Organics, TCI or ABCR. All reactions were performed in ovendried glassware under an atmosphere of argon. The anhydrous solvents for the reactions were obtained by filtration through activated alumina or by storage over activated molecular sieves ( $4 \AA$ Å). Column chromatography (CC) was carried out on silica gel (Sigma-Aldrich, pore size 60 Å, 230-400 mesh, neutralized with $0.1 \% \mathrm{w} / \mathrm{Ca}$ ) as stationary phase. The solvents used for CC were of technical grade and distilled prior to use. Thin-layer chromatography (TLC) was conducted on silica gel plates (Marchery-Nagel, SIL G-25 $\left.\mathrm{UV}_{254}\right)$. The visualisation of the compounds was achieved either under UV light or by staining in dip solution [p-anisaldehyde ( 10 ml ), acetic acid ( 2 ml ), concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}(10 \mathrm{ml})$, and ethanol ( 180 ml )], followed by heating with a heat gun. The NMR spectra were recorded on a Bruker Avance II 400, Bruker Avance III HD 300 or Bruker Avance III HD 400 spectrometer at $400 \mathrm{MHz}\left({ }^{1} \mathrm{H}\right)$, at $101 \mathrm{MHz}\left({ }^{13} \mathrm{C}\right)$, at $376 \mathrm{MHz}\left({ }^{19} \mathrm{~F}\right)$ and at $162 \mathrm{MHz}\left({ }^{31} \mathrm{P}\right)$ in either $\mathrm{CDCl}_{3}$ or $\left(\mathrm{CD}_{3}\right)_{2} \mathrm{SO}$. The chemical shifts ( $\delta$ ) are reported relative to the undeuterated residual solvent peak $\left[\mathrm{CHCl}_{3}: 7.26 \mathrm{ppm}\left({ }^{1} \mathrm{H}\right)\right.$ and $77.16 \mathrm{ppm}\left({ }^{13} \mathrm{C}\right)$; $\mathrm{CHD}_{2} \mathrm{CD}_{3} \mathrm{SO}: 2.50 \mathrm{ppm}\left({ }^{1} \mathrm{H}\right)$ and 39.52 ppm $\left.\left({ }^{13} \mathrm{C}\right)\right]$. The signal assignments are based on APT,( $\left.{ }^{1} \mathrm{H},{ }^{1} \mathrm{H}\right)$ and $\left({ }^{1} \mathrm{H},{ }^{13} \mathrm{C}\right)$ correlation experiments. The chemical shifts of ${ }^{19} \mathrm{~F}$ and ${ }^{31} \mathrm{P}$ NMR are reported relative to $80 \% \mathrm{CFCl}_{3}$ or $85 \% \mathrm{H}_{3} \mathrm{PO}_{4}$ as the external standard. High-resolution mass detections were performed by electrospray ionization on a LTQ Orbitrap XL spectrometer in the positive mode (ion trap, ESI ${ }^{+}$).

### 3.2 UV-melting curves

The UV-melting curves were measured on a Varian Cary Bio 100 UV-vis spectrometer. All experiments were performed with a duplex concentration of $2 \mu \mathrm{M}$ in a NaCl (150 $\mathrm{mM}) / \mathrm{NaH}_{2} \mathrm{PO}_{4}(10 \mathrm{mM})$ buffer ( pH 7 ). To avoid the evaporation of the solvent during the measurement the samples were covered with a layer of dimethylpolysiloxane. The absorbance was monitored at 260 nm . For every sample three cooling-heating circles ( $80 \rightarrow$ 15 or $0{ }^{\circ} \mathrm{C}$ ) were performed with a temperature gradient of $0.5^{\circ} \mathrm{C} / \mathrm{min} . T_{\mathrm{m}}$ values were obtained from the maxima of the curves first derivative and were extracted with the Varian WinUV software. They were reported as an average of at least five ramps.

### 3.3 Circular dichroism spectroscopy

The CD spectra were measured on a Jasco J-715 spectropolariometer equipped with a Jasco PFO-350S temperature controller using the Spectra Manager v1.54 software. The same sample conditions were used as for the UV-melting curves. All spectra were recorded in the range of $210-320 \mathrm{~nm}$ at a scanning speed of $50 \mathrm{~nm} / \mathrm{min}$ at $20^{\circ} \mathrm{C}$. They were baselinecorrected with a blank spectra ( $\mathrm{NaCl}(150 \mathrm{mM}) / \mathrm{NaH}_{2} \mathrm{PO}_{4}(10 \mathrm{mM})$ buffer, pH 7$)$, smoothed and normalized ( $320 \mathrm{~nm}=0 \mathrm{mdeg}$ ). The reported spectra correspond to the average of three scans.

### 3.4 DFT calculations

The conformational analysis of nucleoside 7 was carried out with the Gaussian 09 software [2] by using the second order Møller-Plesset perturbation (MP2) theory and the 6-311G* basis set. The potential energy profile was achieved in varying the pseudorotation phase angle $P$ from $0-360^{\circ}$ (in $10^{\circ}$ steps) at a certain range of the maximum puckering amplitude $v_{\max }\left(25^{\circ}-50^{\circ}\right.$ in $5^{\circ}$ steps). The output was visualised with the OriginPro 2016 software [3].

### 3.5 Oligonucleotide synthesis and purification

The oligonucleotide synthesises were carried out on a LBK Gene Assembler Plus (Pharmacia) DNA synthesiser in a $1.3 \mu \mathrm{M}$ scale. The solid support (dA-Q-CPG 500, dmf-dG-Q-CPG 500) and the natural DNA phosphoramidites ( $d T, d C^{4 b z}, d G^{2 D M F}, d A^{6 B z}$ ) were purchased from Glen Research. The natural DNA phosphoramidites were prepared as a 0.1 $M$ solutions in ACN and were coupled by using a 90 s step. The 6 'diF-bc ${ }^{4,3}$-DNA phosphoramidite was prepared as 0.15 M solution in ACN and the coupling time was extended to 12 min . As a coupling agent 5 -(ethylthio)- 1 H -tetrazole ( 0.25 M in ACN) was used. The capping was performed with a solution of DMAP in ACN ( $0.5 \mathrm{M}, \mathrm{Cap} \mathrm{A}$ ) and a solution of $25 \% \mathrm{Ac}_{2} \mathrm{O}$ and $12.5 \%$ sym-collidine in ACN (Cap B). For the oxidation step a solution of 1.1 M TBHP in DCM was used. The detritylation step was conducted with a solution of 3\% dichloroacetic acid in dichloroethane.

The cleavage from the solid support and the deprotection of the oligonucleotides was achieved by using standard conditions (concentrated ammonia at $55^{\circ} \mathrm{C}$ for 16 h ). Afterwards the tubes were centrifuged, the supernatants were collected, and the remaining beads were washed with MQ-water $(3 \times 500 \mu \mathrm{l})$. The combined supernatants were filtered using spin-
columns (Amicon Ultra 0.5 ml centrifugal filters, MWCO 3kDa) and concentrated to dryness a the Speed-Vac (UniVapo 150, UniEquip).
The crude oligonucleotides were purified by ion-exchange HPLC (DNAPac PA200, Dionex) on an ÄktaTM basic 10/100 system (Amersham Pharmacia Biotech). As mobile phase the following two buffers were used: (A) 25 mM Trizma in $\mathrm{H}_{2} \mathrm{O}, \mathrm{pH} 8$, and (B) 25 mM Trizma, 1.25 M NaCl in $\mathrm{H}_{2} \mathrm{O}, \mathrm{pH} 8$. A linear gradient of $B$ in $A$ was applied over 50 min with a flow rate of $1 \mathrm{ml} / \mathrm{min}$ and detection at 260 nm . The purified oligonucleotides were desalted using Sep-Pak Classic C18 Cartridges (Waters), quantified with a Nanodrop spectrophotometer $(260 \mathrm{~nm})$ and analyzed by LC-MS. The purities were measured by HPLC. The natural DNA and RNA oligonucleotides were purchased from Microsynth AG and re-purified by HPLC and desalted if necessary.

### 3.6 RNase H degradation experiment

## Preparation of stock solutions

Both the positive control antisense strand and the chimeric sense strand were ordered from Microsynth AG. To provide better presentability of results, the sense strand was additionally re-purified using 20\% polyacrylamide gel electrophoresis (acrylamide/bis acrylamide 29:1). The gel bands were eluted three times with $3 \mathrm{ml} \mathrm{dH}_{2} \mathrm{O}$ (once shaking at ambient temperature overnight and twice vortexing briefly), and the eluted oligomer was desalted with a Sep-Pac C18 Classic Cartridge ( 360 mg Sorbent per Cartridge, 55-105 $\mu \mathrm{m}$ Particle Size, 50/pk), and concentrated. It was then re-dissolved with $\mathrm{dH}_{2} \mathrm{O}$, quantified with a Nanodrop ND-1000 Spectrophotometer (Witec AG), and aliquoted to form a usable $1 \mu \mathrm{M}$ stock solution. Regarding the antisense compounds, $10 \mu \mathrm{M}$ stock solutions were prepared in the same manner.

## Radiolabeling of the sense strand

A $20 \mu$ reaction was prepared featuring: (i) 100 pmol of the sense strand, (ii) gamma ${ }^{32} \mathrm{P}$ ATP, 1X polynucleotide kinase buffer ( 50 mM Tris- $\mathrm{HCl}, 10 \mathrm{mM} \mathrm{MgCl} 2,5 \mathrm{mM}$ DTT, 0.1 mM spermidine, pH 7.6 at $25^{\circ} \mathrm{C}$ ), and (iii) T4 polynucleotide kinase (EK0031, Thermo Scientific, added last). This reaction was shaken for 1 h at $37^{\circ} \mathrm{C}$, and subsequently the resulting radiolabeled oligomer was filtered using an Amicon Ultra- 0.5 ml centrifugal filters to remove unreacted gamma ${ }^{32}$ P ATP.

## RNase H reactions

All reactions proceeded in a $20 \mu \mathrm{l}$ total volume and featured: (i) an adequate quantity (> 100 K cpm ) of the $5^{\prime}$ radiolabeled sense strand, (ii) a not radiolabeled ("cold") sense strand ( 0.1 $\mu \mathrm{M}$ ), (iii) an antisense strand ( $2.5 \mu \mathrm{M}$ ), (iv) $1 \times$ RNase H reaction buffer ( 20 mM Tris- $\mathrm{HCl}, 40$ $\mathrm{mM} \mathrm{KCl}, 8 \mathrm{mM} \mathrm{MgCl}, 1 \mathrm{mM}$ DTT, pH 7.8 ). This mixture was heated to $95^{\circ} \mathrm{C}$ for 5 min , and then gradually cooled to rt and subsequently $4^{\circ} \mathrm{C}$ over several hours to ensure annealing. Next, the E. coli RNase H (0.2 Units/ $\mu \mathrm{l}$, EN0201, Thermo Scientific) was added and the reactions were incubated overnight (approximately 15 h ) at $22^{\circ} \mathrm{C}$ with mechanical shaking. Next, an equal volume ( $20 \mu \mathrm{l}$ ) of formamide gel loading buffer was added to denature the strands, and the vials were heated to $95^{\circ} \mathrm{C}$ for $5 \mathrm{~min} .5 \mu$ of this mixture was then added to a lane of a previously prepared $32 \mathrm{~cm} \times 42 \mathrm{~cm} \times 0.2 \mathrm{~mm}$ polyacrylamide gel (20\%, 29:1 acrylamide/bis acrylamide, $1 \times$ TBE, and 7 M Urea). The gel was then inserted into a gel apparatus (Model S2 BRL) with 0.5X TBE buffer in both upper and lower chambers, and connected to a power supply (Life Technologies GIBCO BRL PS 9009) under a constant power (40 W) and variable voltage regime for approximately 3 h . Next, the gel was opened
and placed inside a cassette along with a phosphorimaging plate (Fujifilm), and frozen at -20 ${ }^{\circ} \mathrm{C}$ overnight. Finally, the exposed plate was inserted into a Typhoon Phosphorimager and scanned.

To a suspension of the crude product ( $385 \mathrm{mg}, 0.42 \mathrm{mmol}$ ) in dry toluene ( 4.2 ml ) was added $\mathrm{Bu}_{3} \mathrm{SnH}(0.40 \mathrm{ml}, 1.49 \mathrm{mmol}, 3.5$ equiv) and AIBN ( $7 \mathrm{mg}, 0.04 \mathrm{mmol}, 0.1$ equiv) at rt . Then the reaction mixture was heated up to $90^{\circ} \mathrm{C}$ and was stirred for 30 min at this temperature. After cooling down to rt the solvent was removed under reduced pressure. The residue was adsorbed on silica gel and purified by $\mathrm{CC}\left(\mathrm{hex}^{2} \mathrm{Et}_{2} \mathrm{O} 2: 1 \rightarrow 1: 5\right.$ ) to yield an anomeric mixture of the tricyclic nucleoside $5 \alpha / \beta$ ( $71 \mathrm{mg}, 0.14 \mathrm{mmol}, 34 \%$ over two steps, $\alpha / \beta$-ratio $1: 4.5$ ) and the bicyclo nucleoside 6 ( $79 \mathrm{mg}, 0.20 \mathrm{mmol}, 48 \%$ over two steps). The crystals of 6 which were suitable for X-ray diffraction analysis were obtained by recrystallization in hexane.

## 5. X-ray crystal structure analysis

## Crystal-structure determination of 1-[(3'S,5'S)-2'-deoxy-6',6'-difluoro-3'-O-trimetylsilyl-

 3',5'-propano- $\beta$-D-ribofuranosyl]thymine (6)A crystal of $\mathrm{C}_{16} \mathrm{H}_{24} \mathrm{~F}_{2} \mathrm{~N}_{2} \mathrm{O}_{5} \mathrm{Si}$ was mounted in air at ambient conditions. All measurements were made on an Oxford Diffraction SuperNova area-detector diffractometer [5] using mirror optics monochromated Mo $\mathrm{K} \alpha$ radiation ( $\lambda=0.71073 \AA$ ) and Al filtered [6]. The unit cell constants and an orientation matrix for data collection were obtained from a least-squares refinement of the setting angles of reflections in the range $1.6<\theta<26.7^{\circ}$. A total of 535 frames were collected using $\omega$ scans, with $35+35$ seconds exposure time, a rotation angle of $1.0^{\circ}$ per frame, a crystal-detector distance of 65.0 mm , at $T=173(2) \mathrm{K}$.
Data reduction was performed using the CrysAlisPro program [5]. The intensities were corrected for Lorentz and polarization effects, and an absorption correction based on the multi-scan method using SCALE3 ABSPACK in CrysAlisPro was applied [5]. Data collection and refinement parameters are given in Table S3.

The structure was solved by direct methods using SHELXT [7], which revealed the positions of all non-hydrogen atoms of the title compound. The non-hydrogen atoms were refined anisotropically. All H -atoms were placed in geometrically calculated positions and refined
using a riding model where each H -atom was assigned a fixed isotropic displacement parameter with a value equal to 1.2 Ueq of its parent atom.
Refinement of the structure was carried out on $F^{2}$ using full-matrix least-squares procedures, which minimized the function $\Sigma \mathrm{w}\left(\mathrm{F}_{0}{ }^{2}-\mathrm{F}_{\mathrm{c}}{ }^{2}\right)^{2}$. The weighting scheme was based on counting statistics and included a factor to downweight the intense reflections. All calculations were performed using the SHELXL-2014/7 [8] program.
The crystals contains two molecules in the asymmetric unit ( 8 in the unit cell). Both molecules have the same chirality and they differ only in the conformation especially around the $\mathrm{C}-\mathrm{O}$ bond of the $\mathrm{C}-\mathrm{O}-\mathrm{SiMe}_{3}$. A careful check anyway revealed that there is not symmetry operation relating the two molecules and the unit cell and space group are correct.
