Experimental procedures
1. General experimental information

Commercial grade solvents were used unless stated otherwise. Dry solvents were obtained from a Waters Dry Solvent System. Solvents for chromatography were distilled prior to use. Sensitive reactions were carried out in heat-dried glassware and under an argon atmosphere. Molecular sieves (4 Å) were activated (dried) in a microwave prior for glycosylation reactions. Analytical thin layer chromatography (TLC) was performed on Kieselgel 60 F254 glass plates precoated with silica gel of 0.25 mm thickness. Spots were visualized by staining with sugar stain (1 mL of 3-methoxyphenol in 1 L of ethanol and 30 mL sulfuric acid) or with Hanessian’s stain (5% (w/v) ammonium molybdate, 1% (w/v) cerium(II) sulfate and 10% (v/v) sulfuric acid in water). Silica column chromatography was performed on Fluka Kieselgel 60 (230–400 mesh).

$^1$H, $^{13}$C and two-dimensional NMR spectra were measured with Varian 400-MR and/or 600-MR spectrometers. Chemical shifts (δ) are reported in parts per million (ppm) relative to the respective residual solvent peaks (CDCl$_3$: δ 7.26 in $^1$H and 77.16 in $^{13}$C NMR; CD$_3$OD: δ 3.31 in $^1$H and 49.0 in $^{13}$C NMR; (CD$_3$)$_2$CO: δ 2.05 in $^1$H and 29.84 in $^{13}$C NMR; D$_2$O: δ 4.79 in $^1$H NMR). The following abbreviations were used to indicate peak multiplicities: s singlet; d doublet; dd doublet of doublets; t triplet; dt doublet of triplets; q quartet; m multiplet. Coupling constants ($J$) are reported in hertz (Hz). Optical rotation (OR) measurements were carried out with a Schmidt & Haensch UniPol L1000 polarimeter at $\lambda = 589$ nm and a concentration ($c$) expressed in g/100 mL in the solvent noted in parentheses. High resolution mass spectrometry (HRMS) was performed at the Free University Berlin, Mass Spectrometry Core Facility, with an Agilent 6210 ESI-TOF mass spectrometer. Infrared (IR) spectra were measured with a Perkin Elmer 100 FTIR spectrometer. Abbreviations: RM: reaction mixture, rt: room temperature, MW: microwave.

Theeryl 2-O-benzyl-4,6-O-benzylidene-β-D-galactopyranoside (9)

To a solution of thioglycoside donor **SI-1** (1.1 g, 2.485 mmol) [1] in a mixture of THF/water (10 mL:10 mL), NIS (0.615 g, 2.75 mmol) was added. The RM was stirred at rt for 30 min, quenched with aq. Na₂S₂O₃ (15 mL, 10% solution), and then extracted with DCM (20 mL × 3). The combined organics were washed with saturated NaHCO₃ solution (10 mL), brine (10 mL), dried over Na₂SO₄, filtered, and evaporated in vacuum to obtain a white colored liquid. The crude product was dissolved in DCM (25 mL) and cooled to 0 °C. After addition of imidazole (0.338 g, 4.97 mmol) and TDSCl (0.74 mL, 3.73 mmol), the RM was stirred at rt for 14 h. The RM was diluted with DCM (20 mL) and water (20 mL), and the layers were separated. The organic layer was washed with brine (10 mL), dried over Na₂SO₄, filtered, and concentrated to obtain an oil which was purified by silica gel flash column chromatography using 20% EtOAc in hexanes as eluent to obtain the product as white solid (1.1 g, 82%).

The allyl substrate (1.0 g, 1.849 mmol) and N,N'-dimethylbarbituric acid (DMBA, 0.722 g, 4.62 mmol) were taken in MeOH/THF (15 mL:10 mL) and heated to 45 °C for 2 min, degasified, and filled with argon thrice, followed by the addition of 5 mol % Pd(PPh₃)₄ (0.107 g, 0.92 mmol), and then degasified and filled with argon (twice). The heating of the yellow colored solution at 50 °C was continued for 16 h. The RM was then cooled to rt and diluted with EtOAc (25 mL), washed with NaHCO₃ solution (10 mL), brine (5 mL), dried over Na₂SO₄, filtered, and concentrated in vacuum. Azide substrate 30 (0.42 g, 0.177 mmol) was taken in dry pyridine (4 mL). After the addition of thioacetic acid (2.5 mL, 34.8 mmol), the RM was stirred at rt for 48 h. The RM was then evaporated in vacuum and purified by silica gel chromatography using 30–35% EtOAc in hexanes to recover azide 30 (200 mg) and 40–60% EtOAc in hexanes to obtain compound 31 (228 mg) as white fluffy solid after drying. Additional 1 mL of thioacetic acid and pyridine were added to the RM and stirring was continued for another 48 h. The RM was concentrated in vacuum and purified by silica gel chromatography using 30–35% EtOAc in hexanes to recover azide 30 (100 mg) and 40–60% EtOAc in hexanes to obtain

Substrate 35 (38 mg, 0.016 mmol) was taken in THF (1 mL), treated with a suspension of Pd/C (40 mg) in ethanol (2 mL) and stirred under hydrogen pressure using a balloon for 48 h. The RM was then filtered through a PTFE filter and washed thoroughly with ethanol/water. Evaporation of solvent yielded a colorless material. $^1$H NMR of the crude showed that the reaction was not complete. The crude was resubjected to hydrogenolysis for additional 24 h under the same conditions. The RM was then filtered through a PTFE filter and washed thoroughly with ethanol/water. Evaporation of the solvent yielded a colorless crude product which was then purified using a C$_{18}$-sepak column with water and ethanol as the eluents. Lyophilization of the water fraction yielded the pentasaccharide RU 5 as a white fluffy solid (5.5 mg, 33%).
