General remarks

All reagents were obtained from commercial sources and were used as received. Technical grade petroleum ether (bp 40–60 °C) and ethyl acetate were used for column chromatography. $^1$H NMR spectra were recorded in CDCl$_3$ at ambient temperature on Bruker AVANCE I 300 or 400 spectrometers at 300.1 or 400.1 MHz, using the residual solvent signal as internal standard (7.26 ppm). $^{13}$C NMR spectra were recorded at 75 or 100 MHz and referenced to the internal solvent signals (central peak is 77.2 ppm). Chemical shifts (δ) and coupling constants (J) are given in ppm and in Hz, respectively. The peak patterns are indicated as follows: s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet, and br. for broad. GC analyses were performed with GC-14C (Shimadzu) equipped with a 30 m capillary column (Supelco, SPB-5, fused silica capillary column, 30 M × 0.25 mm × 0.25 mm film thickness), was used with N$_2$/air as vector gas. GC–MS were measured by GCMS-7890A-5975C (Agilent) with GC-7890A equipped with a 30 m capillary column (HP-5ms, fused silica capillary column, 30 M*0.25 mm*0.25 mm film thickness), was used with helium as vector gas. HRMS were measured by MAT 95XP (Termol) (LCMS-IT-TOF). The following GC conditions were used: initial temperature 80 °C, for 2 minutes, then rate 20 °C/min until 260 °C and 260 °C for 20 minutes.

Gram scale procedure for synthesis of 2-(dibenzylamino)ethyl acetate (3a)

KOt-Bu (10 mmol, 1.12 g), 2-methyl-2-oxazole (10 mmol, 0.85 mL), benzyl bromide (20 mmol, 2.38 mL) and DMC (10 mL) were introduced in a tube, equipped with a magnetic stirring bar and the mixture was stirred at 50 °C. After 16 h, the conversion of the reaction was analyzed by gas chromatography. The solvent was then evaporated under vacuum and the desired product was purified by silica gel chromatography using a mixture of petroleum ether/ethyl acetate as eluent to afford 2.38 g (84%) of 3a as light yellow oil.

Procedure for the synthesis of 2-(dibenzylamino)ethanol (6)

K$_2$CO$_3$ (1.0 mmol, 112 mg), 2-(dibenzylamino)ethyl acetate (0.5 mmol, 142 μL), and methanol (2 mL) were introduced in a tube, equipped with a magnetic stirring bar and the mixture was stirred at room temperature. After 24 h, the conversion of the reaction was analyzed by gas chromatography. The solvent was then evaporated under vacuum and the desired product was purified by silica gel column chromatography using a mixture of petroleum ether/ethyl acetate as eluent to afford 106 mg (88%) of product 6 as light yellow oil.
