## 1. General chemistry procedures

All reactions were carried out under an inert atmosphere, unless otherwise noted. Reactions and purifications were monitored by thin layer chromatography using Silica gel 60 F254 (pre-coated on aluminium sheet, 0.2 mm thickness, Merck). Chromatographic purification was performed with silica gel 60 (230-400 mesh, Merck), reversed phase C18 silica gel.

## General procedure for hydroxamic acid synthesis

To the stirred solution of the starting material ethyl/methyl ester ( 0.02 mmol ) in methanol $(1.0 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}, \mathrm{NaOH}(0.75 \mathrm{mmol})$ in methanol $(1.0 \mathrm{~mL})$ was added at $-10^{\circ} \mathrm{C}$ followed by the addition of $50 \%$ aqueous hydroxylamine solution ( $0.3 \mathrm{~mL}, 0.02 \mathrm{mmol}$ ) at $-10^{\circ} \mathrm{C}$ and gradually allowed to attain room temperature and stirred for 12 h . TLC revealed complete consumption of starting material. Saturated ammonium chloride solution was added and the reaction mixture was evaporated under reduced pressure and azeotrope with methanol to remove water. C18 column was performed. After several trials with MeOH and DCM, water and ACN, water and THF, Water and MeOH. It was found pure compound was isolate by carrying out the column only in water and gradually increasing methanol. The compound got eluted in $10 \% \mathrm{MeOH}: 90 \%$ water mixture.
