## 1. General experimental details

Anhydrous tetrahydrofuran was freshly distilled from sodium/benzophenone ketyl. Other solvents were treated before use by standard methods. All starting materials were of the highest available grade (Aldrich, Fluka, Merck) and were used without further purification. Commercially available cobalt(II) chloride hexahydrate was dried in an oven (2 h at 150 °C) and then dried by heating under vacuum until it turned blue, before use. Flash column chromatography was performed with Merck silica gel 60 (0.040–0.063  $\mu\text{m}$ , 240–400 mesh). Reactions were monitored by thin-layer chromatography on silica gel plates (Merck 60, F<sub>254</sub>) and visualized under UV light and/or using 5% phosphomolybdic acid in ethanol and by CG-MS.

## 2. Instrumentation and analysis

Nuclear magnetic resonance (NMR) spectra were recorded on a Bruker ARX-300 spectrophotometer using  $\text{CDCl}_3$  as the solvent and tetramethylsilane (TMS) as internal reference. Mass spectra (EI) were obtained at 70 eV on an Agilent 7890B gas chromatograph coupled with an Agilent 5977A mass selective detector (MSD) (Agilent, Santa Clara, CA), equipped with HP-5MS capillary column (30 m  $\times$  0.25 mm inner diameter, 0.25  $\mu\text{m}$  film thickness), using nitrogen as carrier gas. Infrared (FTIR) spectra were obtained on a Nicolet-Nexus spectrophotometer.

The CoNPs/MgO catalyst was characterized by Transmission Electron Microscopy (TEM) on a JEOL 100CX2 instrument, operated at an acceleration voltage of 100 kV. Near one hundred metal particles were measured to perform the particle size distribution. The Energy Dispersive X-ray spectroscopy (EDX) analysis was done on an Electron Microscopy SEM LEO EVO 40 XVP - EDS Oxford X-Max 50 device.

Cobalt content in the supported catalyst was determined by Inductively Coupled Plasma Atomic Emission Spectroscopy (ICP-AES) on a Spectro Arcos instrument. X-ray diffraction (XRD) analyses were performed using a Bruker AXS D8 Advance diffractometer, equipped with a  $\text{Cu-K}\alpha_{1,2}$  radiation source. Atomic Absorption Spectroscopy (AAS) was carried out on a Perkin Elmer AAnalyst200 spectrometer. X-ray photoelectron spectroscopic analyses (XPS) were performed on a PHI 548 spectrometer, using  $\text{Mg K}\alpha$  radiation at 250 W and 20 mA. The resolution spectra were taken at 50 eV of pass energy, giving an absolute resolution of  $\pm 0.5$  eV. The operation base pressure was kept in  $10^{-10}$  Torr range. The adventitious C 1s binding energy was taken as a charge reference and fixed at 284.8 eV.

### 3. Preparation of the CoNPs/MgO catalyst

A mixture of lithium sand (21 mg, 3.0 mmol) and 4,4-di-*tert*-butylbiphenyl (DTBB, 26 mg, 0.1 mmol) in THF (3 mL), was stirred at room temperature under nitrogen atmosphere. When the reaction mixture turned dark green (5–10 min), indicating the formation of the corresponding lithium arenide, anhydrous  $\text{CoCl}_2$  was added (130 mg, 1.0 mmol). The resulting suspension was stirred until it turned black (15–30 min), indicating the formation of cobalt nanoparticles. Immediately after that, it was diluted with THF (10 mL) and MgO (800 mg) was added. The resulting suspension was stirred for 1 h, and then bidistilled water (2 mL) was added to eliminate the excess of lithium. The resulting solid was filtered under vacuum in a Buchner funnel and washed successively with water (10 mL) and acetone (10 mL). Finally, the solid was dried under vacuum (5 Torr).

#### 5. Representative procedure for the epoxidation of alkenes

The CoNPs/MgO catalyst was activated by heating in an oven at 150 °C for 1 h. To a vigorously stirred suspension of the CoNPs/MgO catalyst (10 mg) in MeCN (1.0 mL) under air the corresponding alkene (0.5 mmol in 1.0 mL MeCN) and TBHP (63  $\mu$ L of an 80 wt % solution in H<sub>2</sub>O, 0.5 mmol in 1.0 mL MeCN) were added and the sealed reaction flask was immersed in an oil bath at the reflux temperature of MeCN (82 °C). The reaction mixture was stirred at this temperature until no further conversion of the starting alkene was observed (TLC, GC). Then, the reaction mixture was centrifuged and the supernatant removed. The solvent was evaporated in vacuo, and the crude product was purified by flash column chromatography (silica gel, hexane/AcOEt) to give the corresponding epoxide. The recovered solid catalyst was washed with acetonitrile (3  $\times$  2 mL) and dried in oven (150 °C, 1 h) for its reuse.

#### 6. Product characterization data

The following known compounds included in Table 2 were characterized by comparison of their chromatographic and spectroscopic data (FTIR, <sup>1</sup>H NMR, <sup>13</sup>C NMR, and MS) with those described in the literature: styrene oxide (**2a**),<sup>1,2</sup> 1-dodecene oxide (**2b**),<sup>3,4</sup> 2-benzylloxirane (**2c**),<sup>5,6</sup> *trans*-2,3-diphenyloxirane (**2d**),<sup>7,8,9</sup> 2-methyl-3-phenyloxirane (**2e**),<sup>8,10</sup> 1-bromo-2,3-epoxy-3-phenylpropane (**2f**),<sup>11,12</sup> 4-(oxiran-2-yl)phenyl acetate (**2g**),<sup>13,14</sup> 2-methyl-2-phenyl oxirane (**2h**),<sup>7,15</sup> 2,2-
