1. General information

The aldiminium hydrogen dichloride \(3b\) (CAAC-Dip-Cy-2HCl) was purchased from TCI and the tetrafluoroborate salts \(3a\) (CAAC-Mes-Cy-HBF$_4$) (Apeiron AS1056) and \(3c\) (CAAC-Die-MePh-HBF$_4$) (Apeiron AS1042) were kindly supplied by Apeiron Synthesis. All the syntheses of dithiocarboxylate zwitterions were carried out under a dry argon or nitrogen atmosphere using standard Schlenk techniques. Solvents were distilled from appropriate drying agents and deoxygenated prior to use. Sodium tert-butoxide and potassium bis(trimethylsilyl)amide (1 M solution in THF) were purchased from Aldrich. All the other chemicals were purchased from Aldrich or TCI and used without any further purification. Melting points were measured with an Electrothermal 9100 apparatus and are not corrected. $^1$H and $^{13}$C NMR spectra were recorded at 298 K on a Bruker DRX 400 spectrometer operating at 400.13 and 100.62 MHz, respectively. Chemical shifts are listed in parts per million downfield from TMS and are referenced from the solvent peaks or TMS. Infrared spectra were recorded in the ATR mode on a Nicolet iS5 FT-IR spectrometer. Electrospray ionization mass spectra were obtained using a Micromass LCT Premier instrument. Elemental analyses were carried out in the Laboratory of Pharmaceutical Chemistry at the University of Liège.

Caution: azides are heat- and shock-sensitive compounds that may decompose violently. They must be handled using appropriate safety precautions. Any attempt to scale up the procedures listed below should be carefully evaluated.

A saturated aqueous solution of NaNO$_2$ (5.17 g, 75 mmol) was added to a mixture of 2,4,6-trimethylaniline (6.46 g, 48 mmol), water (20 mL), and AcOH (20 mL) cooled to 0 °C in an ice/water bath. After 1 h, a saturated aqueous solution of NaN$_3$ (5.72 g, 88 mmol) was added dropwise at 0 °C. The reaction mixture was warmed to room temperature and further stirred for 1 h. It was diluted with Et$_2$O (100 mL) and distilled water (100 mL). Solid Na$_2$CO$_3$ was slowly added until the pH of the aqueous phase reached 7. The two phases were separated and the aqueous phase was
extracted with additional Et₂O (2 × 60 mL). The combined organic phases were washed with distilled water (40 mL) and brine (40 mL). The resulting organic phase was dried over anhydrous MgSO₄ and filtered. The filtrate was concentrated on a rotary evaporator and dried under high vacuum to afford the desired mesityl azide as a yellow-orange oil kept in a refrigerator (6.96 g, 90% yield).

^1H NMR (400 MHz, CDCl₃, 298 K): δ = 6.84 (s, 2H, m-CH₃), 2.34 (s, 6H, o-CH₃), 2.26 ppm (s, 3H, p-CH₃). ^13C NMR (100 MHz, CDCl₃, 298 K): δ = 135.4 (p-C₆H₄), 134.5 (CN), 131.9 (α-C₆H₄), 129.6 (m-C₆H₄), 20.8 (p-CH₃), 18.1 ppm (α-CH₃). These data matched those reported in the literature [1].

2.2. Synthesis of 1-mesityl-4-phenyl-1H-1,2,3-triazole

2-Azido-1,3,5-trimethylbenzene (6.7 g, 42 mmol) was dissolved in CH₃CN (27 mL) in a 100 mL round-bottomed flask and the solution was cooled to 0 °C in an ice/water bath. A solution of CuSO₄·5H₂O (1.04 g, 4.16 mmol) and sodium ascorbate (3.95 g, 20 mmol) in water (14 mL) followed by phenylacetylene (6.45 g, 63.17 mmol) were added dropwise. The reaction mixture was slowly warmed to room temperature and stirred overnight. Acetonitrile was removed on a rotary evaporator and a small amount of CH₂Cl₂ was added to dissolve the solid materials. The reaction was quenched by adding a concentrated solution of aqueous NH₄OH until the pH became basic and the resulting mixture was stirred for 3 h at room temperature. It was extracted with CH₂Cl₂ (4 × 30 mL) and the combined organic phases were dried over anhydrous MgSO₄. The solvent was removed on a rotary evaporator and the crude product was recrystallized from n-heptane to yield pure 1-mesityl-4-phenyl-1H-1,2,3-triazole as a white solid (7.47 g, 68% yield).

^1H NMR (400 MHz, CDCl₃, 298 K): δ = 7.93 (d, J = 7.2 Hz, 2H, CH₃Ph), 7.83 (s, 1H, NCH), 7.47 (t, J = 7.6 Hz, 2H, CH₂Ph), 7.37 (t, J = 7.4 Hz, 1H, CH₂Ph), 7.01 (s, 2H, m-CH₂Mes), 2.37 (s, 3H, p-CH₃Mes), 2.02 ppm (s, 6H, o-CH₃Mes). ^13C NMR (100 MHz, CDCl₃, 298 K): δ = 147.7 (C₆H₄), 140.2 (p-C₆H₄Mes), 135.3 (α-C₆H₄Mes), 133.6 (i-C₆H₄Mes), 130.6 (i-C₆H₄Ph), 129.3 (m-CH₂Mes), 129.1 (α-C₆H₄Ph), 128.4 (p-CH₂Ph), 125.9 (m-CH₂Ph), 121.6 (NCH), 21.3 (p-CH₃Mes), 17.5 ppm (α-CH₃Mes). These data matched those reported in the literature [2].
2.3. Synthesis of 4-butyl-1-mesityl-1H-1,2,3-triazole

2-Azido-1,3,5-trimethylbenzene (3.44 g, 15 mmol) was dissolved in CH$_3$CN (10 mL) in a 50 mL round-bottomed flask and the solution was cooled to 0 °C in an ice/water bath. A solution of CuSO$_4$·5H$_2$O (0.37 g, 1.5 mmol) and sodium ascorbate (1.39 g, 7 mmol) in water (5 mL) followed by 1-hexyne (1.83 g, 22.3 mmol), were added dropwise. The reaction mixture was slowly warmed to room temperature and stirred overnight. The reaction was quenched by adding a concentrated solution of aqueous NH$_4$OH until the pH became basic and the resulting mixture was stirred overnight at room temperature. It was extracted with CH$_2$Cl$_2$ (4 × 20 mL) and the combined organic phases were dried over anhydrous MgSO$_4$. The solvent was removed on a rotary evaporator and the residue was dried under high vacuum to yield 4-butyl-1-mesityl-1H-1,2,3-triazole as a dark yellow oil (3.14 g, 88% yield).

$^1$H NMR (400 MHz, CDCl$_3$, 298 K): δ = 7.29 (s, 1H, NCH), 6.92 (s, 2H, m-CH$_{ar}$ Mes), 2.78 (t, $J = 7.7$ Hz, 2H, CH$_2$ Bu), 2.29 (s, 3H, p-CH$_3$ Mes), 1.90 (s, 6H, o-CH$_3$ Mes), 1.69 (quint, $J = 7.6$ Hz, 2H, CH$_2$ Bu), 1.38 (sext, $J = 7.4$ Hz, 2H, CH$_2$ Bu), 0.91 ppm (t, $J = 7.4$ Hz, 3H, CH$_3$ Bu). $^{13}$C NMR (100 MHz, CDCl$_3$, 298 K): δ = 148.1 (C$_{ar}$), 139.7 (p-C$_{ar}$ Mes), 135.1 (o-C$_{ar}$ Mes), 133.7 (i-C$_{ar}$ Mes), 128.9 (m-CH$_{ar}$ Mes), 122.5 (NCH), 31.5 (CH$_2$CH$_2$CH$_2$ Bu), 25.3 (CH$_2$CH$_2$CH$_2$ Bu), 22.3 (CH$_2$CH$_3$ Bu), 21.1 (p-CH$_3$ Mes), 17.2 (o-CH$_3$ Mes), 13.8 ppm (CH$_3$ Bu). These data matched those reported in the literature [3].

2.4. Synthesis of 1-(2,6-diisopropylphenyl)-4-phenyl-1H-1,2,3-triazole

Freshly distilled 2,6-diisopropylaniline (5.56 g, 31 mmol) was dissolved in CH$_3$CN (20 mL) in a 50 mL round-bottomed flask and the solution was cooled to 0 °C in an ice/water bath. 90% t-BuONO (6.21 mL, 4.85 g, 47 mmol) and 95% Me$_3$SiN$_3$ (5.12 mL, 4.34 g, 37 mmol) were sequentially added dropwise at 0 °C, and stirring was maintained for 2 h at 0 °C. A solution of CuSO$_4$·5H$_2$O (0.79 g, 3.1 mmol) and sodium ascorbate (3.09 g, 15 mmol) in water (10 mL) followed by phenylacetylene
(4.74 g, 47 mmol) were added dropwise. The reaction mixture was slowly warmed to room temperature and stirred overnight. The reaction was quenched by adding a concentrated solution of aqueous NH₄OH until the pH became basic and the resulting mixture was stirred overnight at room temperature. It was extracted with CH₂Cl₂ (4 × 25 mL) and the combined organic phases were dried over anhydrous MgSO₄. The solvent was removed on a rotary evaporator and the crude product was washed with n-pentane to yield 1-(2,6-diisopropylphenyl)-4-phenyl-1H-1,2,3-triazole as a white solid (2.86 g, 30% yield).

¹H NMR (400 MHz, CDCl₃, 298 K): δ = 8.01 – 7.94 (m, 2H, CH₉ Ph), 7.9 (s, 1H, NCH), 7.52 (dt, J = 13.3, 7.8 Hz, 3H, CH₉ Ph), 7.43 – 7.37 (m, 1H, CH₉ Dip), 7.34 (d, J = 7.8 Hz, 2H, CH₉ Dip), 2.37 (sept, J = 6.8 Hz, 2H, CH iPr), 1.20 (d, J = 8.0, Hz, 6H, CH₃ iPr), 1.18 ppm (d, J = 4.0 Hz, 6H, CH₃ iPr).

¹³C NMR (100 MHz, CDCl₃, 298 K): δ = 147.4 (C₉ ar), 146.1 (o-C₉ Dip), 133.2 (i-C₉ Dip), 130.9 (i-C₉ Ph), 130.4 (p-C₉ Ph), 129.0 (m-C₉ Ph), 128.4 (p-C₉ Dip), 125.8 (o-C₉ Ph), 123.9 (m-C₉ Dip), 122.4 (NCH), 28.4 (CH iPr), 24.4 (CH₃ iPr), 24.1 ppm (CH₃ iPr). These data matched those reported in the literature [4].

2.5. Synthesis of 1-mesityl-3-methyl-4-phenyl-1H-1,2,3-triazol-3-ium iodide (5a)

![Chemical Structure]

1-Mesityl-4-phenyl-1H-1,2,3-triazole (2.5 g, 9.5 mmol), acetonitrile (16 mL), and methyl iodide (8.1 g, 57 mmol, 6 equiv) were stirred and heated in a closed Schlenk tube placed in an oil bath at 80 °C for 48 h. After cooling to room temperature, the solvent was removed on a rotary evaporator. The orange sticky residue was washed with hot ethyl acetate (6 × 10 mL) and dried under high vacuum to afford 1-mesityl-3-methyl-4-phenyl-1H-1,2,3-triazol-3-ium iodide as an off-white solid (3.6 g, 94% yield).

3.1. Typical procedure

An oven-dried 50 mL round-bottomed flask equipped with a magnetic stirring bar and capped with a three-way stopcock was charged with an aldminium salt (2.5 mmol). The reactor was purged of air by applying three vacuum/nitrogen cycles before dry THF (25 mL) was added. The suspension was cooled to 0 °C in an ice/water bath before a 1 M solution of KN(SiMe3)2 in THF (3 mL, 3 mmol) was slowly added with a syringe. The cooling bath was removed and the reaction mixture was
stirred for 30 min at room temperature. After the solid had settled down, the supernatant solution was transferred with a cannula and filtered through Celite under an inert atmosphere into a two-neck 100 mL round-bottomed flask equipped with a magnetic stirring bar and capped with a three-way stopcock. The filtering device was rinsed twice with dry THF (2 x 5 mL). Carbon disulfide (0.5 mL, 8.3 mmol) was added with a syringe to the carbene solution. A color change occurred instantaneously. After 30 min of stirring at room temperature, the solvent was evaporated under vacuum. The residue was brought back to air, washed twice with n-pentane (2 x 5 mL), and dried under high vacuum.

4. Synthesis of MIC-CS$_2$ zwitterions with KN(SiMe$_3$)$_2$

4.1. Typical procedure

An oven-dried 25 mL round-bottomed flask equipped with a magnetic stirring bar and capped with a three-way stopcock was charged with a triazolium salt (1 mmol). The reactor was purged of air by applying three vacuum/nitrogen cycles before dry THF (10 mL) was added. The suspension was cooled to 0 °C in an ice/water bath before a 1 M solution of KN(SiMe$_3$)$_2$ in THF (1.2 mL, 1.2 mmol) was slowly added with a syringe. The cooling bath was removed and the reaction mixture was stirred for 30 min at room temperature. After the solid had settled down, the supernatant solution was transferred with a cannula and filtered through Celite under an inert atmosphere into a two-necked 100 mL round-bottomed flask equipped with a magnetic stirring bar and capped with a three-way stopcock. The filtering device was rinsed twice with dry THF (2 × 5 mL). Carbon disulfide (0.2 mL, 3.3 mmol) was added with a syringe to the carbene solution. A color change occurred instantaneously. After 30 min of stirring at room temperature, the solvent was evaporated under vacuum. The residue was brought back to air and washed twice with petroleum ether (2 × 10 mL). It was recrystallized from acetonitrile.

5. Synthesis of MIC-CS₂ zwitterions with NaO⁻Bu

5.1. Typical procedure

An oven-dried 25 mL round-bottomed flask equipped with a magnetic stirring bar and capped with a three-way stopcock was charged with a triazolium salt (1 mmol) and sodium tert-butoxide (0.48 g, 5 mmol). The reactor was purged of air by applying three vacuum/nitrogen cycles before dry THF (10 mL) was added followed by carbon disulfide (1 mL, 16.6 mmol). The reaction mixture was stirred for 1 h in an oil bath at 60 °C. After cooling down to room temperature, the solvent was evaporated under vacuum. The residue was taken up with dichloromethane (2 × 10 mL) and
filtered through a filter paper. The filtrate was concentrated under reduced pressure. The remaining solid was washed twice with n-pentane (2 x 5 mL) and dried under high vacuum.

6. X-ray crystal structure determinations

6.1. Experimental details

Data for compound 6b were collected on a Bruker APEX II diffractometer using the Mo Kα radiation (λ = 0.71073 Å) from a fine focus sealed tube source at 100 K. Data for all the other compounds were collected on a Bruker D8 VENTURE PHOTON III-14 diffractometer using an Incoatec multilayer mirror monochromated with the Cu Kα radiation (λ = 1.54178 Å) from a microfocus sealed tube source at 100 K and with a detector resolution of 7.3910 pixels mm⁻¹. Computing data and reduction was made with the APEX 3 software [7]. Absorption corrections based on the multiscan method were applied [8]. All the structures were solved using SIR2004 [9]. They were refined by full-matrix, least-squares based on F² using SHELXL [10]. An empirical absorption correction was applied using SADABS [11]. All non-hydrogen atoms were anisotropically refined and the hydrogen atom positions were calculated and refined using a riding model.
Deposition Numbers 2130664–2130667 (for compounds 4a, 4c, 6b, and 6e, respectively) contain the supplementary crystallographic data for this paper.
