I) General procedures

All reactions were carried out under an argon atmosphere with dry solvents under anhydrous conditions, unless otherwise noted. Anhydrous methylene chloride (CH₂Cl₂), diisopropylamine (iPr2NH) and hexamethyl phosphoryl triamide (HMPA) were distilled before use from calcium hydride. Diethyl ether (Et₂O), toluene, and tetrahydrofuran (THF) were distilled before use from sodium-benzophenone ketyl. Acetic acid (AcOH), acetonitrile (MeCN), acetic anhydride (Ac₂O), acetone, methanol (MeOH), dimethyl sulfoxide (DMSO), ethanol (EtOH), ethyl acetate (EtOAc), methyl tert-butyl ether (MTBE), petroleum ether (PE, b.p. 60-90 °C), pyridine and triethylamine (Et₃N) were purchased at the highest commercial quality and used without further purification. Reactions that required heating were operated on a magnetic stirrer with an oil bath. Solvent degassing was conducted by bubbling with a stream of argon. Reactions were monitored by thin-layer chromatography (TLC) carried out on silica gel plates (0.4–0.5 mm) using UV light as visualizing agent and an ethanolic solution of ammonium molybdate, anisaldehyde, and heat as developing agents. Photo reactions were performed on the XPA-7 chemical reactor (Nanjing Xujiang Electromechanical Plant). Flash chromatography was performed with silica gel (200-300 mesh). NMR spectra were recorded on a Bruker AV-400 instrument and calibrated using residual undeuterated solvent as an internal reference. The following abbreviations were used to explain the multiplicities: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, br = broad, dd = doublet of doublets, dt = doublet of triplets, td = triplet of doublets, ddd = doublet of doublets. Melting points (m.p.) were

recorded on a Büchi B-540 melting point apparatus. Optical rotation data were obtained on a PerkinElmer Model 341 Polarimeter. High-performance liquid chromatography (HPLC) analyses were performed on a Shimadzu Essentia LC-16 HPLC system, and the detection of eluent was carried out with SPD-M40 photodiode array detector at 210 nm. High-resolution mass spectra (HRMS) were recorded on Waters MALDI SYNAPT G2-Si High Definition Mass Spectrometry. X-ray diffraction data were obtained on Bruker D8 Venture, and the ORTEP drawings were generated using *Olex2* (Version 1.5) [1].

R_f = 0.42 (silica gel, PE:EtOAc 2:1); [α]p²⁰ = +29.0 (c = 0.5, CHCl₃); ¹H NMR (400 MHz, acetone- d_6) δ = 7.70 (br s, 1 H), 7.60 (t, J = 1.8 Hz, 1 H), 7.06 (t, J = 3.9 Hz, 1 H), 6.57 (d, J = 1.4 Hz, 1 H), 5.36 (s, 1 H), 4.48 (t, J = 5.1 Hz, 1 H), 3.67 (s, 3 H), 3.59 (d, J = 17.6 Hz, 1 H), 3.26 (s, 3 H), 3.25 (s, 3 H), 3.24 (s, 3 H), 3.02–2.96 (m, 1 H), 2.90–2.83 (m, 1 H), 2.67 (dt, J = 15.5, 2.1 Hz, 1 H), 2.57–2.51 (m, 1 H), 2.49–2.38 (m, 3 H), 2.34 (dt, J = 15.5, 1.6 Hz, 1 H), 1.95 (ddd, J = 14.4, 10.9, 7.5 Hz, 1 H), 1.76 (s, 3 H), 1.72 (t, J = 5.3 Hz, 2 H), 1.36 (dd, J = 14.3, 6.6 Hz, 1 H), 1.04 (s, 3 H), 0.98 (s, 3 H); ¹³C NMR (100 MHz, acetone- d_6) δ = 197.5, 174.0, 169.2, 149.0, 148.0, 144.1, 142.1, 138.8, 136.7, 122.5, 110.9, 103.5, 77.5, 75.4, 55.8, 53.3, 52.9, 52.4, 51.9, 48.4, 44.3, 42.8, 42.0, 37.1, 32.9, 26.7, 23.6, 21.9, 16.1, 15.0 ppm; HRMS (ESI): calcd for C₃₀H₄₀O₉Na⁺ [M + Na]⁺ 567.2565, found 567.2571.

Preparation of enone 10:

To a stirred solution of the dienone **31** (8.16 mg, 15.0 μ mol, 1.0 equiv) and AcOH (1.72 μ L, 0.03 mmol, 2.0 equiv) in CH₂Cl₂ (5.0 mL) was added into a quartz tube and purged with argon gas for 5 min. The resulting mixture was stirred at 20 °C and irradiated with a 254 nm lamp (500 W) for 35 min before it was quenched with NaHCO₃ (10 mL, sat. aq.). The layers were separated, and the aqueous layer was extracted with

 CH_2Cl_2 (3 × 10 mL). The combined organic layers were dried (Na₂SO₄) and concentrated in vacuo. Flash column chromatography (silica gel, PE:EtOAc 1:1) afforded enone **10** (6.27 mg, 73%) as a white solid.
