Conditions for the analysis of diarylmethanols by GC and HPLC

General information:

The GC analyses were performed in an Agilent 6890N GC apparatus, with an Agilent HP-5 column and a FID detector. In every case, 1 μ L of an approximately 15 μ M solution of the product was injected. The injector was heated at 250 $^{\circ}$ C, and the mobile phase was He at 12 psi constant pressure, with a 25:1 split ratio. The detector was heated at 300 $^{\circ}$ C, with a 35 mL/min flow of H₂ and 350 mL/min of air.

The HPLC analyses were done in Agilent 1100 and 1200 series HPLC apparatus.
